Description	Statement	Mitigation	Additional information	Affected Packages	CVSS Score Details	Weakness (CWE)	FAQ
-------------	-----------	------------	------------------------	-------------------	--------------------	----------------	-----

## Description

A flaw was found in util-linux. Improper hostname canonicalization in the `login(1)` utility, when invoked with the `-h` option, can modify the supplied remote hostname before setting `PAM_RHOST`. A remote attacker could exploit this by providing a specially crafted hostname, potentially bypassing host-based Pluggable Authentication Modules (PAM) access control rules that rely on fully qualified domain names. This could lead to unauthorized access.

## Statement

This issue was rated as a Low severity issue. This is an authorization policy bypass limited to host-based access control decisions. It does not bypass authentication or grant elevated privileges. Exploitation is configuration-dependent and primarily affects legacy or uncommon remote login pathways, but it can violate administrator intent and weaken PAM-based security policy enforcement.

## Mitigation

Mitigation for this issue is either not available or the currently available options do not meet the Red Hat Product Security criteria comprising ease of use and deployment, applicability to widespread installation base or stability.

## Additional information

- Bugzilla 2442570: util-linux: util-linux: Access control bypass due to improper hostname canonicalization
- CWE-289: Authentication Bypass by Alternate Name

## Affected Packages and Issued Red Hat Security Errata

-  Unless explicitly stated as not affected, all previous versions of packages in any minor update stream of a product listed here should be assumed vulnerable, although may not have been subject to full analysis.

## Common Vulnerability Scoring System (CVSS) Score Details

**Important note**

CVSS scores for open source components depend on vendor-specific factors (e.g. version or build chain). Therefore, Red Hat's score and impact rating can be different from NVD and other vendors. Red Hat remains the authoritative CVE Naming Authority (CNA) source for its products and services (see Red Hat classifications).

**CVSS v3 Score Breakdown**

	Red Hat	NVD	CVE List
<b>CVSS v3 Base Score</b>	3.7	5.3	N/A
<b>Attack Vector</b>	Network	Network	N/A
<b>Attack Complexity</b>	High	Low	N/A
<b>Privileges Required</b>	None	None	N/A
<b>User Interaction</b>	None	None	N/A
<b>Scope</b>	Unchanged	Unchanged	N/A
<b>Confidentiality Impact</b>	None	None	N/A
<b>Integrity Impact</b>	Low	Low	N/A
<b>Availability Impact</b>	None	None	N/A

## CVSS v3 Vector

**Red Hat:** CVSS:3.1/AV:N/AC:H/PR:N/UI:N/S:U/C:N/I:L/A:N

**NVD:** CVSS:3.1/AV:N/AC:L/PR:N/UI:N/S:U/C:N/I:L/A:N

**Technical Impact:** Bypass Protection Mechanism

## Frequently Asked Questions

Why is Red Hat's CVSS v3 score or Impact different from other vendors? 

My product is listed as "Under investigation" or "Affected", when will Red Hat release a fix for this vulnerability? 

What can I do if my product is listed as "Will not fix"? 

What can I do if my product is listed as "Fix deferred"? 

What is a mitigation? 

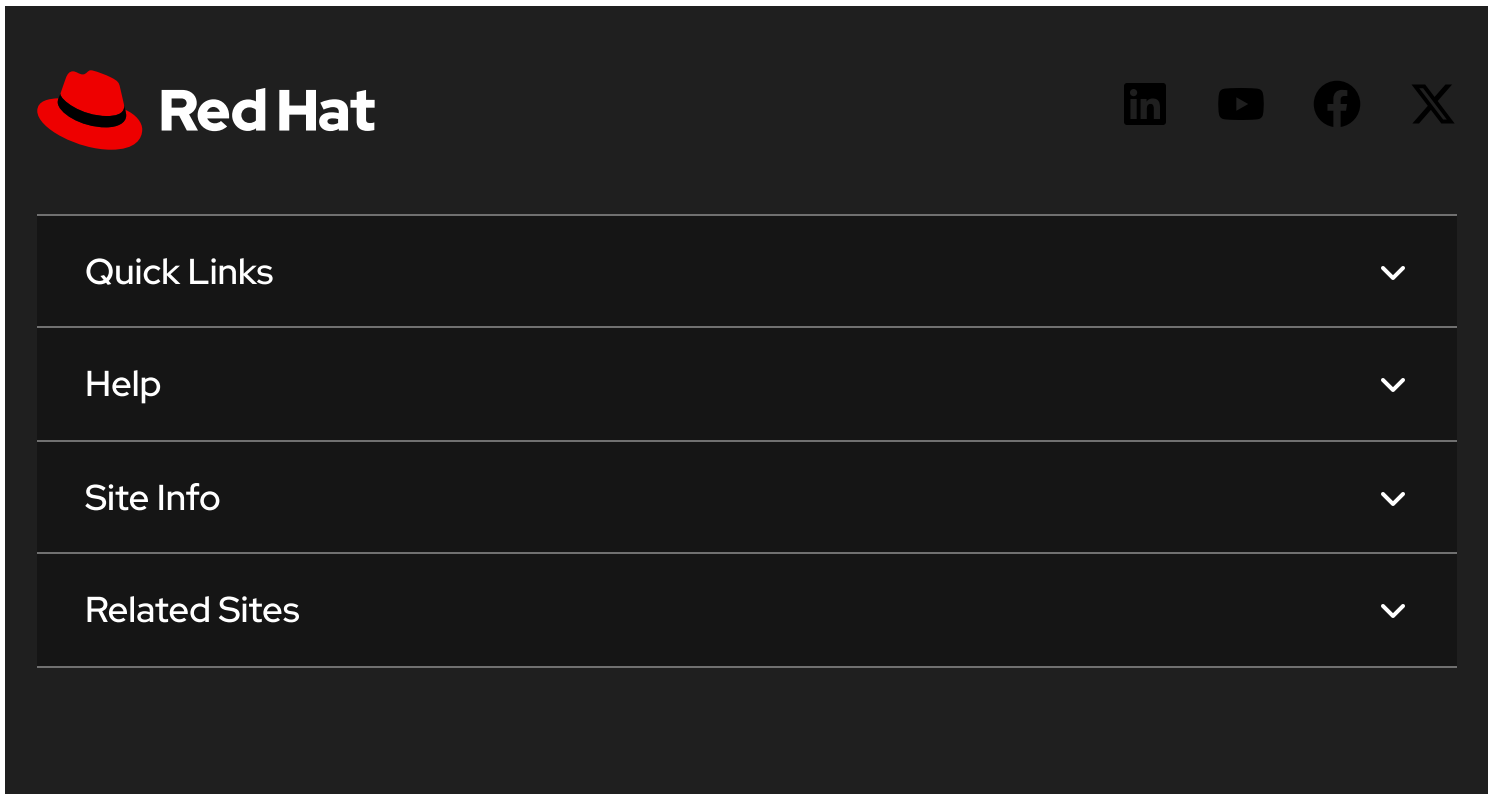

- I have a Red Hat product but it is not in the above list, is it affected? ▼
- Why is my security scanner reporting my product as vulnerable to this vulnerability even though my product version is fixed or not affected? ▼

Not sure what something means? Check out our Security Glossary.
