automatic.css v4.0.1

Changelog

Keep track of what's new with ACSS! For details on specific features and utilities, please check the official documentation.

NEW ENHANCE FIX

ACSS

OCTOBER 7, 2026

3.3.8

Automatic.css 3.3.8 reduces unnecessary upgrade-lock activity, improves PHP 8.4 compatibility, and fixes WS Form group label styling when using .form–dark and .form–light.

- **WS Form label**
- **PHP 8.4 no longer fills error logs**
- **Dashboard documentation links**

ACSS

AUGUST 13, 2026

4.0.1

This release fixes the license activation issues some of you ran into after the 4.0.0 launch, repairs form styling for WS Form, and cleans up a handful of smaller bugs. Updating is safe — everything migrates automatically, and your custom settings are untouched.

- Licensing
- Dashboard
- Form Styling
- Other Fixes

ACSS

AUGUST 11, 2026

4.0.0

Important
This release includes important security hardening. If you're running an Automatic.css 4.x prerelease, we recommend upgrading to 4.0.0 as soon as possible. Existing v3 sites should remain on v3 because v4 is not backward compatible.

Automatic.css 4.0.0 is here — the culmination of the alpha, beta, and release candidate cycles that shaped ACSS 4. This milestone brings all of that work together and completes the transition to the permanent v4 plugin and licensing setup. Follow the upgrade guide before installing.

Alongside the work completed throughout the prerelease cycle, this release restores ACSS color workflows in Bricks 2.2+, adds the option to disable effects while editing in Bricks and Etch, improves WordPress 7 compatibility, and includes useful refinements throughout the dashboard and generated CSS.

The changes below are the additions and fixes included specifically in 4.0.0:

automatic.css v4.0.1

- Automatic.css 4.0.0 installs as a new plugin
- The new Disable Effects In Page Builders option keeps effects out of the way while editing in Bricks and Etch
- Manage your Automatic.css license with WP-CLI
- Transparent color swatches now insert modern color-mix(in oklch, var(--primary) 10%, transparent) values
- Content grid exclusion styles now use lower specificity, giving you more control and making them easier to override.
- Dashboard help links open the ACSS cheat sheet
- The license key field now asks browsers and password managers to disable autocomplete and save prompts
- License requests now identify themselves to our servers
- License activation and checks are less likely to be disrupted by third-party plugins.
- ACSS color workflows are back in Bricks 2.2 and later! Right-clicking Background and Typography color swatches once again inserts ACSS variables directly into the color field.
- Hide Deactivated Classes works correctly on WordPress 7 without triggering the wp_enqueue_script() notice in Bricks
- Update checks no longer throw a Class not found fatal when malformed transient data requires a new stdClass instance
- Logged entries now render safely in the dashboard, log growth stays bounded, and rotated Activity Log and debug log files remain protected

automatic.css

- Dashboard license checks are now restricted to authorized administrators

ACSS

AUGUST 9, 2026

3.3.7

Automatic.css 3.3.7 improves content offset on Bricks sites that use background video. License activation and checks are also less likely to be disrupted by third-party plugins, and now include information that helps us prevent Cloudflare from blocking legitimate requests.

- Documentation, community, and support links now take you to their latest destinations.
- The license key field now asks browsers and password managers to disable autocomplete and save prompts.
- In Bricks, ACSS no longer applies content offset spacing to background-video wrappers.
- License activation and checks are less likely to be disrupted by third-party plugins
- Dashboard license checks are now restricted to authorized administrators.

ACSS

NOVEMBER 6, 2025

3.3.6

- Add support for Context Menus and AutoBEM in Bricks v2

automatic.css v4.0.1

- Fix the Color Switcher button for Bricks 2
- Improve handling of max-width on list items
- Fix skip link text color overridden by link color
- Fix margin--none resetting padding instead of margin
- Ribbon fix
- Fix External Link Indication breaking text wrapping in links
- Fix overflow issue with font awesome icons
- Forms: text color of focused input was unreadable (especially for dark forms)
- Forms: added select and multiselect missing style
- Forms: the flag is now centered in the phone field
