ClamAV 0.100.1 has been released!

ClamAV 0.100.1 is a hotfix release to patch a set of vulnerabilities.

- Fixes for the following CVE's:
  - CVE-2017-16932: Vulnerability in libxml2 dependency (affects ClamAV on Windows only). (https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-16932)
  - CVE-2018-0360: HWP integer overflow, infinite loop vulnerability. Reported by Secunia Research at Flexera. (https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2018-0360)
  - CVE-2018-0361: ClamAV PDF object length check, unreasonably long time to parse relatively small file. Reported by aCaB. (https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2018-0361)
- Fixes for a few additional bugs:
  - Buffer over-read in unRAR code due to missing max value checks in table initialization. Reported by Rui Reis.
  - Libmspack heap buffer over-read in CHM parser. Reported by Hanno Böck.
  - PDF parser bugs reported by Alex Gaynor.
    - Buffer length checks when reading integers from non-NULL terminated strings.
    - Buffer length tracking when reading strings from dictionary objects.
- HTTPS support for clamsubmit.
- Fix for DNS resolution for users on IPv4-only machines where IPv6 is not available or is link-local only. Patch provided by Guilherme Benkenstein.

Thank you to the following ClamAV community members for your code submissions and bug reports!

- aCaB
- Alex Gaynor
- Guilherme Benkenstein
- Hanno Böck
- Rui Reis
- Laurent Delosieres, Secunia Research at Flexera
