OSIDB Bzimport  2025-04-15 01:32:18 UTC[Description](#)

A heap-buffer-overflow (off-by-one) vulnerability exists in the template parsing logic within the certtool utility of GnuTLS. The vulnerability specifically occurs when parsing certain multiline configuration options from a user-supplied template file, allowing an attacker to cause an out-of-bounds (OOB) NULL pointer write, resulting in memory corruption and potential denial-of-service (DoS).
