Command injection in logcat processing

CVE: CVE-2026-114355 ↗

Product: DJI CrystalSky ZS600C

Severity: High 8.6

Published: 21.10.2026

The `hardware_monitor` helper, which runs as root, reads lines from the Android log (logcat) and passes a field from each line to a shell `eval`. Any process on the device can write to logcat, so a local unprivileged attacker can inject a command that the root helper executes.

Affected firmware: v0.3.9.7 through v0.6.6.9 (last release; device is EOL/unsupported). Verified on device (`uid=0`).
