Divi Ajax Filter Changelog

/* CHANGELOG */

VERSION 5.4.6 – 21/10/26

- FIX – Syncing the catalog index now keeps products when a custom field number is too big for the index. Those products were still skipped, so a category could count fewer products than it contains.
- FIX – Attribute filters such as size now stay on a translated shop when empty options are hidden. Those options were removed even though the products on the page still have those attributes.
- FIX – Choosing a translated category or attribute now includes products that are still filed under the original language term.
- FIX – Choosing a filter on a category or colour page with the catalog index turned on keeps that category or colour. The list was being replaced by the whole catalogue, and categories set to be left out were showing.
- FIX – Filtering no longer stops with a critical error when the results request has no page number.

VERSION 5.4.5 – 19/10/26

- FIX – The first item in a Post Carousel that uses a custom loop layout now shows the same icons, text alignment, and button styling as the items after it.
- FIX – Choosing a product attribute, such as colour, now shows the matching products when the price slider has not been moved. A product could disappear even though it had the attribute you picked.
- FIX – Product titles in a loop keep the same size and line spacing when you open another page. The title was still switching to the larger preset size after you clicked a page number.
- FIX – Filtering a shop or category keeps the categories and colours already set on that list, including ones that are left out. Choosing a filter was showing the whole catalogue, and the result count did not match those products.
- FIX – Search results show the matching articles again when a site search plugin such as Relevanssi is active. The results page was empty even though those articles still appeared in their categories.

- FIX – Choosing a filter on the second page of similar products shows the matching products again. That page was staying selected, so the shorter list came back empty.
- FIX – Clicking a loop item still opens its page after you filter, including in Firefox. The link on the item was dropped when the list refreshed, and showing all items did not bring it back.

VERSION 5.4.4 – 15/10/26

- MOD – Filter choices can be saved and run again later by other Divi Engine plugins, such as Divi Machine Account search alerts.
- FIX – Archive Loop Offset now stays in place when you open another page of results. Page 2 no longer repeats the last post from the previous page, and going back to page 1 no longer brings back the post Offset was set to skip. The result count stays the same.
- FIX – Filtering no longer causes a critical error when the results refresh without a filter selected. The list of results still loads.
- FIX – Thumbnail in a custom loop layout now shows the featured image of that loop item, such as a related team member on a single post.
- FIX – Product titles in a loop keep the same font when you open another page. Italic and weight were dropping off after you clicked a page number.
- FIX – Filters now update the product or post list in the same part of the page. When the page also had a list in the header, that list changed instead, the main list stayed the same, and some filter choices were missing.
- FIX – Unticking an option in the filters and clicking Search now removes its filter tag when the tags are shown above the results or in a custom area.
- FIX – Filtering a map of locations no longer mixes the pin popup design with the location cards. The popup title stays fully visible, and the cards keep their own layout.
- FIX – Map pin popups keep their spacing without sliding the logo and button upward, and clicking a pin opens the popup.
- FIX – With clustering turned off and a map popup layout loaded by AJAX, Divi's own pins are removed once the loop markers are on the map. Both sets of pins were showing at once.
- FIX – Filtering a page with a map no longer stops when the map has not finished loading. The location list still updates.

VERSION 5.4.3 – 13/10/26

- FIX – Minimal List loop template now shows the author and date when they are turned on in the loop template settings. The meta separator setting is used between items as well.

- FIX – Archive Loop keeps a fixed custom field rule, such as only rooms whose purpose is coaching, when you filter and when you click Reset. Choosing a location and another filter now returns the same rooms whichever you pick first. A multi-select value is matched whether it was saved as a list or as a single value.
- FIX – Archive Loop shows the posts it should when a site search plugin is active, instead of leaving some out before anyone has searched.
- FIX – Syncing the catalog index no longer leaves products out when a price or custom field number is too large to store. The product is indexed, and that number is left out.
- FIX – The next page of similar products on a product page loads again. It was coming back empty after an update, even though those products were still on the list.
- FIX – The Search button on Search Posts shows on the live page again. It was hidden even though it appeared in the Visual Builder.

VERSION 5.4.2 – 10/10/26

- FIX – Map pin popups that use a saved layout keep that layout's spacing and text styling. The bubble was opening the layout with none of its design.
- FIX – A filter brought over from Divi 4 no longer causes a critical error on the page. The space above each filter label is applied again.

VERSION 5.4.1 – 09/10/26

- FIX – Product titles inside a carousel or product loop stay on the card. The title could be printed above the page, leaving a blank gap and making the rest of the page open that product.
- FIX – Loop template Read More buttons now show the icon chosen under Loop Template Button, including when that icon is set to appear as soon as the page loads.
- FIX – ACF and custom field filters set to a dropdown no longer show a PHP warning and raw markup instead of the dropdown.
- FIX – With caching turned on, filter choices now update after you pick a filter. Choices with no matching posts, such as a location with nothing in the category you picked, were still offered, and picking one showed no results.
- FIX – Modules that use Divi display conditions inside a loop, such as a Register Now button that only shows on some events, stay visible after you filter or search.

VERSION 5.4.0 – 06/10/26

- NEW – Filter Posts and Filter Posts Item (Divi 5): label text, filter item text, Show More / Show Less text, and filter option spacing can be styled in the Design tab again, and fields

support hover background and text colours.

- NEW – Archive Loop ACF Date Picker sorting can keep Today and Future (and other date ranges) while ordering results by published date instead of the event date.
- FIX – Filter Posts Item (Divi 5): Module border settings now apply on the live page, so you can add line dividers under each filter section without boxing the options.
- FIX – Filter Posts (Divi 5): Filter item padding now applies reliably on the live page when set in Design settings.
- FIX – Custom loop product cards no longer get large empty gaps between the image, title, price and button. Divi's default column spacing was stacking on top of each module's own spacing.
- FIX – A saved-posts list, such as a wishlist, shows those posts again on Divi 5 after the page is migrated. The list was empty.
- FIX – Custom loop layouts on Archive Loop and Post Carousel keep their spacing and text styling on first load and on later pages, including carousels that use a relationship.
- FIX – Category filters stay visible on a custom post type loop that is limited to one category. The choices were flashing on load and then disappearing, even though the loop still showed posts in those categories.
- FIX – Saving a page or post no longer hangs when filter caching is turned on and the Redis or Memcached server cannot be reached. The Divi builder's Save button could spin forever while the plugin waited for the cache server; it now gives up after a couple of seconds and the save finishes.
- FIX – Buttons and other design styles in a custom loop layout keep their colours after you filter. A View Post button, for example, was losing its background once the posts reloaded.
- FIX – Dropdown filters now drop choices that have no matching posts once you pick another filter. A location could stay in the list, and could still be selected, even when nothing matched it together with the category you had already chosen.
- FIX – Thumbnail Size can be chosen again in the Thumbnail module on Divi 5 sites that use BodyCommerce. The size list had failed to load, so images in a custom loop stayed on the full size and those pages loaded more slowly.
- FIX – Filter Update Method can be set to On change in the Divi 5 builder again. The choice was greyed out and did not save, so a dropdown filter stayed on the Search button.
- FIX – Loading the next products on a shop or category page no longer freezes the page. You can keep scrolling while those products appear.
- FIX – Product category pages and normal pages with more than one product loop no longer show an extra product grid at the top of the page. Loops you hide on desktop,

tablet, or phone stay hidden, and linked product titles in those loops still show the product name.

- LOOP EXTENDER UPDATE
- NEW – ACF Date Picker loops can keep Today and Future (and other date ranges) while sorting results by published date instead of the event date.
- MOD – WordPress no longer flags Loop Extender as untested on WordPress 7.1.
- FIX – The Divi Engine settings screen now loads when Loop Extender is the plugin providing that menu.
- FIX – Sorting a Loop by a WordPress custom field now uses the meta key you enter instead of leaving posts in the default order.

VERSION 5.3.2 – 30/09/26

- MOD – Archive Loop (Divi 5): Equal Height Posts is hidden when Grid Style is Masonry, since equal-height cards do not work with masonry.
- FIX – Custom loop layouts on Divi 5 now show multiline custom field text, such as ACF textareas, instead of leaving those fields blank.
- FIX – Custom field and ACF filters set to "Select Drop Down" now open a list you can tick several options in, instead of showing a plain dropdown that only lets you pick one.
- FIX – Google Maps is only loaded once on pages that use an address or distance filter alongside Divi Form Builder or a Divi Map. Loading it twice stopped map pins and address suggestions from working.
- FIX – Divi 4 Archive Loops on a custom post type archive show their posts again when the saved Post Type can no longer be matched, instead of showing the "no results" layout or blog posts.
- FIX – Loops that use a custom Divi layout no longer cause a critical error (HTTP 500) on the front end of Divi 5 sites that also run another Divi plugin adding its own modules, such as Divi Pixel. This affected Divi Machine's Carousel and Archive Loop.
- FIX – Archive Loop on Divi 5 now shows the correct related posts when Relationship Type is set to Custom Field, Tags, or Custom Taxonomy. It was matching on the post's categories instead, so a loop showed posts, but not the ones you set it up to show. The Visual Builder preview now matches the live page too.
- FIX – WooCommerce modules such as Price, Title and Add To Cart in Divi 5 Archive Loop custom layouts now show details for each product on the card, instead of repeating the same product on every card in the grid.
- FIX – Divi 5 Archive Loops can once again use an ACF Taxonomy field on the current post to show posts from its selected categories or terms, matching the equivalent Divi 4 setup.

- FIX – Infinite Scroll now shows its selected loading animation beside the products being loaded instead of hiding it or placing it outside the visible part of a long product grid.
- FIX – Opening or sharing a filtered link on a Divi 5 Loop Builder page now shows one active filter tag with the proper category name, instead of adding a second tag showing the raw slug, such as "bac-3" next to "BAC+3".
- FIX – Filters, the sort dropdown and buttons on product cards such as wishlist keep working after a filter update that does not finish cleanly. Previously the loading state could be left in place, which left the filter area unclickable, kept a "Select Drop Down" filter stuck open and stopped any further filtering or sorting until the page was reloaded.
- FIX – Ajax Filter no longer removes other plugins' scripts that listen for AJAX requests to finish, which could stop features such as custom product card buttons from working after filtering.
- FIX – Load More keeps the sort order you chose. When sorting by a number stored in a custom field, such as power or capacity, the extra products were ordered as text, so 10 came before 2 and the grid looked shuffled after clicking Load More.
- FIX – The sort order chosen in the Order By module or the WooCommerce sorting dropdown now stays applied while you carry on filtering. Previously the order was only correct on the sort itself, and the next filter tick, range slider change or page click put the loop back into its own order, which was most obvious on loops set to Random.
- FIX – Opening or sharing a filtered link now shows a single active filter tag with the proper category name. A second tag showing the raw value, such as "bac-5" beside "BAC+5", could still be added by another part of the page after the previous fix.
- FIX – Filter dropdowns no longer show "var" in front of the first option when that text starts with dashes, such as "– Choisir un pays –".
- FIX – Include Tags on an Archive Loop now keeps a custom post type that uses the normal Tags list limited to those tags, on the first load and when you filter. The loop and map were still showing every post.
- FIX – Divi Machine's Archive Loop now does the same for Include Tags, Exclude Tags, and tags that apply on load only. A custom post type that uses the normal Tags list was still showing every post, including on the map.

VERSION 5.3.1 – 18/09/26

- FIX – The Plugins screen no longer offers a Divi Ajax Filter update that cannot be installed. Sites whose licence is not active for that web address were shown "Automatic update is unavailable for this plugin", and updating then failed with "Update package not available".

- FIX – License activation now reports missing plugin data safely instead of causing a critical error when multiple Divi Engine plugins are active.

VERSION 5.3.0 – 17/09/26

- NEW – With Ajax Filter debug on, catalog sync for Elasticsearch, Typesense, and Cloud Index writes failed item IDs and reasons to the WordPress debug log. Elasticsearch sync also shows the first error in settings, matching Typesense.
- FIX – Custom loop layouts on Archive Loop keep the spacing and sizing set in the layout, including percentage margins, on the live page in Divi 5.
- FIX – Archive Loop “To this post (reverse)” on a Divi 5 Theme Builder layout now uses the public post being viewed, so linked custom posts filter correctly instead of listing every post.
- FIX – The Divi 5 Visual Builder loads again after updating to 5.2.5.
- FIX – Filters now work correctly when advertising or analytics tracking details are present in the page address.
- FIX – Archive Loop set to "Show empty on load" no longer breaks the layout of the sections below it. On Divi 5, those sections were being pulled inside the section holding the loop until a filter was applied.
- FIX – Archive Loop cards show on the first page load in Safari and on mobile, instead of appearing only after a filter is clicked. This affected Divi 5 loops placed in a column whose content alignment is set to something other than the default.

VERSION 5.2.5 – 14/09/26

- MOD – Filter scripts and styles now load only on pages that use an Ajax Filter or Archive Loop, reducing unused files on the rest of the site.
- MOD – Loop settings now explain when a custom Divi layout may slow larger product grids and recommend faster Loop Templates for shop archives.
- MOD – Added a guided workflow for creating and fine-tuning new Archive Loop template designs for Divi 5 and Gutenberg.
- MOD – The shop sorting dropdown shows "Default sorting" again on shop and category pages. "Relevance" is now only offered on search results, matching WooCommerce.
- FIX – Archive Loop set to Current User’s Posts or reverse Post Object / Relationship only shows the intended posts (your own posts, or posts linked to the current page), keeps the post type set on the module, and stays limited after filtering, sorting, Load More, or clicking All.
- FIX – Archive Loop on archive and Theme Builder body layouts no longer shows no posts when Relationship is set to "to this post" but there is no current post. Term filters still

apply.

- FIX – Related listings on a team member (or other single) page now show when the relationship field stores IDs as numbers.
- FIX – Exclude Terms by custom field value (for example Property Type “Residential Lease”) now works for basic text fields, including on relationship loops.
- FIX – Clearing or unticking the last filter on a related product loop shows the same number of products as when the page first loaded, including on sites using catalog search / Elasticsearch, and changing Order By now sorts those products.
- FIX – Archive Loop now uses the Price (and other ACF) sort order set on the module, including descending price.
- FIX – Product loops keep the order you set, including the manual order from Products › Sorting and price order for variable products, when moving between pages or filtering.
- FIX – The shop sorting dropdown now shows on the first page load of a product loop, instead of only appearing after filtering or moving to another page.
- FIX – Reset now keeps the categories excluded on the loop itself and clears the sort order, so results and the Order By dropdown go back to how the page first loaded.
- FIX – Selected filter choices stay visible when another filter gives them no matches. Removing a filter tag now clears that choice, updates the results, and updates the page address right away.
- FIX – Filter options with no matching results now stay hidden on the first page load and after clicking All, on loops that are limited by a custom field (for example a page showing one collection).
- FIX – Range slider and date filters keep their full width when "Display checkbox/radio inline" is turned on, instead of being squashed into a narrow strip on desktop.
- FIX – Range slider filters now show their handles in the right place when the filter starts closed, is inside a toggle, or opens from the mobile filter button.
- FIX – Checkboxes and radio buttons in filters show their box and selected tick or dot again, instead of appearing as blank grey boxes or labels only.
- FIX – Checkbox filters set to Select Drop Down can be opened and closed again when the Filter Posts module uses Toggle style.
- FIX – Collapsible Sub Terms expand and collapse again when the filter is used with Divi Machine.
- FIX – The mobile filter panel now closes after a selection when Auto-Close Toggle on Filter is enabled and the results use Divi’s Loop Builder.
- FIX – With Sync Filter Items turned on, picking a second choice from the same category now updates a Loop Builder grid.
- FIX – Infinite scroll shows a single loading indicator instead of two at once.

- FIX – Load More keeps loading the rest of your products or posts when the Enhanced Load More setting is turned off, instead of adding two batches, then stopping and hiding the button.
- FIX – Searching from a Search Posts form with Live Search enabled no longer doubles the typed words on the search results page.
- FIX – Previous and Next links on a Divi loop keep the wording set in the pagination module (including translations) when paging through filtered results.
- FIX – Archive Loop shows its posts to logged-out visitors again on sites where the loop worked when logged in but showed nothing when logged out.
- FIX – Filtered pages no longer show a critical error when Advanced Custom Fields is not active.
- FIX – Filter result caching with WordPress DB Cache now works after you turn it on, without extra site configuration.
- FIX – The Enable caching toggle in Ajax Filter settings now stays on after saving.
- FIX – The Check Connection button in Caching and Performance now tests your Redis or Memcached server and reports a failure quickly if it cannot be reached.
- FIX – Product loop template cards keep their images inside the card when the template is used by another Divi Engine plugin, such as BodyCommerce product loops.
- FIX – Post Title backgrounds in custom loop layouts now stay after filtering or changing sort order.
- FIX – Protected posts handled by Divi Membership keep a stable card layout in custom loop modules (including carousels) when a restricted message or layout is shown.
- FIX – Opening the Sorting settings of a loop module no longer crashes the Divi 5 Visual Builder when filter settings have not loaded.
- FIX – Post Title in the Visual Builder no longer errors when editing a Divi Library layout or when the heading tag has not been saved yet.
- FIX – Archive Loop, Thumbnail Size options, and featured-image preview load again in the Visual Builder on Divi Machine sites.
- FIX – Plugin status used by the Visual Builder is only available to logged-in editors, not to visitors.
- FIX – Turning on filter debug from the page address now also logs Loop Builder filter activity in the browser console.

VERSION 5.2.4 – 20/08/26

- FIX – Visual Builder no longer crashes when opening Ajax Filter module settings.
- FIX – Archive Loop template preview images now load in the Visual Builder.

- FIX – Filter option counts load correctly for logged-in visitors.

VERSION 5.2.3 – 20/08/26

- FIX – Divi Machine Visual Builder now builds when Ajax Filter is included with the plugin.
- FIX – Sites no longer show a critical error when Divi Ajax Filter is active alongside Divi Machine and Divi BodyCommerce.

VERSION 5.2.2 – 20/08/26

- NEW – Archive Loop Blog Cards: a card layout with a category badge on the image, plus title, excerpt, and date. Hover title colour, a stronger card shadow, and a fully clickable card are on by default and can be changed like any other setting.
- FIX – Archive Loop post titles now use the Title Text Color set on the Hover tab.
- FIX – Protected posts handled by Divi Membership keep a stable card layout in custom loop modules (including carousels) when a restricted message or layout is shown.
- FIX – Sites no longer show a critical error when both Divi Machine and Divi BodyCommerce are active.

VERSION 5.2.1 – 19/08/26

- FIX – The Catalog Index and Auto Suggest settings screens are available again instead of showing a "Pro" upgrade notice, as Divi Ajax Filter includes all features.
- FIX – Divi 4 pages keep the Free-Form CSS added to a section, row, or module (Advanced tab) when an Archive Loop with a custom loop layout sits further down the page. That CSS is no longer copied into every loop card, or lost altogether, so page designs such as full-height banners display correctly.

VERSION 5.2.0 – 18/08/26

- FIX – Loop Builder columns keep widescreen (and other breakpoint) widths after pagination or filtering instead of falling back to the desktop column count.
- FIX – No-results loop layouts keep the Button hover border width/color from the layout (Divi theme button hover no longer forces a 1px border).
- FIX – Archive Loop custom layouts show images, text, and button links on first load, and after filtering, Button links that open in a new tab and Image lightbox keep working.
- FIX – After filtering, Thumbnail hover overlay keeps your chosen color and icon instead of reverting to the default overlay.
- FIX – Loop Template options such as Enable Author, Enable Date, Enable Categories, Content Display, Meta Separator, and excerpt length are respected on initial display and

after filtering, including Divi 4 layouts and Load More — loops no longer fall back to showing the author, date, and an excerpt.
- FIX – Separate Filter Posts Item modules keep their own custom labels and All option text under WPML instead of sharing one translated title across every Tag (or similar) filter.
- FIX – On-change filters update results correctly when another Filter Posts module on the page uses a Search button.
- FIX – Divi 4 modules (Filter Posts, Search Posts Item, Thumbnail, and Post Title) load correctly again.
- FIX – Price, number, and date range values carried in the page URL (for example after searching from another page) are now matched as a range, so filtering on the results page no longer returns no results.
- FIX – Sites no longer show a critical error when a plugin that bundles Ajax Filter (such as Divi Machine or BodyCommerce) is running an older bundled copy alongside the latest filter files.
- FIX – The License Management screen no longer asks for a Divi Ajax Filter license key when Ajax Filter is included with Divi Machine or BodyCommerce, as those licenses already cover it.

VERSION 5.1.3 – 11/08/26

- FIX – Filtering or resetting large Archive Loop grids that use the Post Title module in a custom loop layout no longer freezes the browser.
- FIX – Free-text search Filter Parameter tags show reliably after filtering, including when Auto Suggest or live search is enabled, so the search can be cleared with the X without using Clear All Filters.
- SECURITY – Custom loop templates only load from the child theme templates folder, blocking unsafe file paths (CVE-2026-11613).

VERSION 5.1.2 – 10/08/26

- FIX – Related product loops keep the original related products when clearing or changing filters, filter option counts stay limited to those products (including with catalog search / Elasticsearch), and empty terms with no matches no longer appear selectable.
- FIX – Multiple Selection with OR logic on checkbox filters correctly matches any of the selected terms.
- FIX – Filter parameter tags with quotes in the label (for example 4" x 3") no longer duplicate, and unchecking or removing them clears the tag correctly.

- FIX – Sites no longer crash with a critical error when BodyCommerce (or another plugin that bundles Ajax Filter) loads Ajax Filter more than once.

VERSION 5.1.1 – 09/08/26

- NEW – Works with Divi Nitro page cache: filtered URLs stay as their own cached pages, and saving layouts clears related Nitro cache.
- MOD – Always uses the Divi Engine settings hub (no longer switches to the legacy settings panel when Nitro, Protect, Mobile, Mega Menu, or other Divi Engine plugins are active).
- FIX – Public filters no longer accept unpublished post statuses from visitors without permission, and filter option counts look up custom fields more securely.
- FIX – Catalog debug details are only available to administrators, and public filter and search requests respect the catalog rate limit setting.
- FIX – Hosted index collection delete is limited to this site's collections, Cloud Index checkout return URLs stay on the same site, and Typesense search reads prefer the search-only API key when configured.
- FIX – Archive Loop Relationships now respect Exclude Terms (taxonomy and custom field), and Include ACF no longer breaks reverse relationships.

VERSION 5.1.0 – 06/08/26

- NEW – Divi 5 Filter Posts Item Design includes Radio / Checkbox Button and Active Button controls (padding, border, background, and more) when Appearance is Buttons.
- NEW – Auto suggest and live search use the catalog index (Elasticsearch, Typesense, Cloud, or built-in) when enabled, so typeahead matches titles and SKUs faster.
- NEW – Thumbnail Design includes Framing (object fit and position) like Divi's Image module, and Divi 4 Thumbnail adds image border controls.
- NEW – Grouping Taxonomy Title design includes spacing, border, and background.
- MOD – Divi 5 Select2 setting description no longer says to also enable it on the main Filter Posts module.
- FIX – Gap Between Each Item on inline checkbox/radio filters now controls spacing.
- FIX – Category, tag, taxonomy, and attribute filter options respect Term Order "Name" (alphabetical), even when another plugin custom-orders terms.
- FIX – Auto suggest "Rebuild search phrase index now" button is clearly visible again.
- FIX – Custom loop layouts no longer crash the site on older Divi 5 builds.
- FIX – Thumbnail in Category Loop custom layouts shows the category image again (and the WooCommerce placeholder when none is set).

- FIX – Loop Builder keeps page styling, multi-column grid layout, Previous/Next navigation, and new-tab button behavior after filtering and pagination.
- FIX – Checkbox/radio filters (category, tag, taxonomy, ACF, custom meta, and stock status) now check the "All" option by default when nothing is selected.
- FIX – Text search works again after Reset when filters update on change.
- FIX – Divi 4 Product / Archive Loop modules that used the default Products post type now keep Products after Divi 5 migration instead of switching to Auto Detect.
- FIX – Inline field tags in custom loop layouts also show correctly on tablet and phone when the text module has different content per device.
- FIX – Custom loop layouts (including View Post modal) keep card styles, images, buttons, and section design after filtering or Load More on Divi 5.
- FIX – Archive Loop again includes Most Popular, Out of Stock only, New products (with days), and Show Hidden Products options from Divi 4 Product Loop.
- FIX – Collapsible Sub Terms arrows show on every parent with children, rotate when expanded or collapsed, and no longer also select the parent when using Divi Style.
- FIX – Loop Enable Overlay icon only shows on the product being hovered, not every product.
- FIX – Load More and pagination after filtering keep the correct category and filter results when catalog search (Elasticsearch/Typesense) is enabled, including related product filters on product pages.
- FIX – Related product filters keep category, range, and attribute matching after filtering (Theme Builder and Loop Templates), exclude the product you are viewing, and Reset returns the original related results.
- FIX – Related Products Include Attributes match the current product and support "All of the values", without requiring every parent and child category at once.
- FIX – Category and shop archives no longer apply related-product range constraints on first load (result counts stay correct).
- FIX – Range and other filters no longer remove sibling filter constraints when updating one field.
- FIX – Subcategory checkbox filters indent the checkbox with the label, not only the text.
- FIX – Limit Height more/less no longer shows when the filter is set to Select.
- FIX – Filter Parameters design styles apply when tags show above the loop.
- FIX – Background Image overlay color shows correctly (not overridden by Color Theme).
- FIX – Hide empty options on page load works again with inline checkbox filters.
- FIX – Enable caching and related settings toggles can be turned off and stay off after saving.

- FIX – WPML String Translation no longer floods with duplicate filter and Archive Loop labels (including BodyCommerce).
- FIX – Post Title custom prefix, suffix, and title overrides no longer create a new WPML string for every loop item.
- FIX – No Results Layout can be chosen when Loop Style is Loop Templates, is used on first load for empty results, and keeps its styles after filtering on Divi 4.

VERSION 5.0.0 – 24/07/26

- FIX – When a parent term is auto-deselected after choosing a subcategory, its Filter Parameter tag is removed too.
- FIX – Collapsible Sub Terms arrows work again for hierarchical taxonomy filters (including All Parent and Sub Terms).
- FIX – Background Image overlay on hover only applies to the hovered item, not every item in the loop.
- MOD – Collapsible Sub Categories setting label renamed to Collapsible Sub Terms.

VERSION 5.0.0 – 24/07/26

- NEW – Category and attribute filter counts update faster when using Elasticsearch, Typesense, or Cloud catalog search.
- NEW – Catalog index settings let you choose a search engine (WordPress, built-in index, Typesense, Elasticsearch, ElasticPress, or Cloud) and configure connection options from Divi Engine settings.
- NEW – Built-in catalog index stores products and posts locally for faster category, price, and text filters, with a step-by-step setup wizard, one profile per post type, faster facet counts, optional daily rebuild, and automatic updates when you save or publish content.
- NEW – Cloud index uses Divi Engine's hosted search with trial, subscribe, and billing from plugin settings, automatic API key setup, and per-site collections.
- NEW – Typesense catalog uses separate collections per post type with a step-by-step wizard (including ACF and Secure Custom Fields checklist, and product categories, attributes, SKU, and price), automatic collection schema, and admin sync for recent products and posts.
- NEW – Elasticsearch catalog settings support direct index setup, bulk sync, and filtered search without requiring ElasticPress.
- NEW – Typesense and ElasticPress catalog engines power filtered search when configured in catalog settings.
- NEW – Catalog Sync and Rebuild show live progress (for example 500/5000) and the total indexed when finished.

- NEW – Elasticsearch and Typesense catalog search apply custom numeric and ACF range filters in the index (re-run Setup and Sync so numeric fields are available).
- NEW – Auto suggest while typing on Filter Posts text search in Divi 5, with phrase index rebuild in Divi Ajax Filter settings.
- NEW – Search filter has a Browser Autocomplete setting (on by default) so you can turn off unwanted previous-search suggestions from the browser.
- NEW – ACF date sorting option to show today and future events, and keep multi-day events visible until their end date has passed.
- NEW – Checkbox category filters can automatically uncheck a parent category when a subcategory is selected, so results narrow to the subcategory while still allowing multiple sibling selections.
- MOD – Divi Loop Builder layouts use catalog-powered filtering when a search index engine is enabled, matching Archive Loop behavior.
- MOD – Rich live search dropdown on Filter Posts is a Divi Machine feature; Divi Ajax Filter includes auto suggest and archive refresh only.
- MOD – Archive loop text search no longer refreshes the full loop on every keystroke when only suggestions are enabled.
- FIX – Filter Posts and Filter Posts Item no longer crash on Divi 5; modules also load correctly when only Ajax Filter is active, and activation no longer crashes with Divi 5 enabled.
- FIX – Filtering updates the product grid again after a previous count request was cancelled.
- FIX – When two Loop Builder filters use the same category or tag group, choosing options from both shows only posts that match all of those selections.
- FIX – Load More and filter no longer apply hover or transform styles from one image in a custom loop layout to another image on the page.
- FIX – Category filter parent terms keep collapsible rows and rolled-up counts when the Archive Loop only includes child categories, and filters can still show related categories that have posts in the included set (for example countries) while following include and exclude rules.
- FIX – Choosing a category filter (for example a country) no longer drops the Archive Loop include categories, so results stay limited to the included set instead of showing unrelated posts such as regular blog posts.

VERSION 4.3.1 – 17/07/26

- FIX – Load More no longer repeats posts already on the page when the Archive Loop is set to random order.

- FIX – In the Divi 5 Visual Builder, Thumbnail Size can be changed again (including Divi Library layouts), and Thumbnail previews no longer fail when a layout has no matching posts.
- FIX – Archive Loop with Display Type "Custom Taxonomy" applies taxonomy filters from the URL on first load (for example make/brand on search result pages).
- FIX – Custom loop layout styles, including Custom CSS, now apply correctly when loading more products with infinite scroll or Load More on Divi 4 and BodyCommerce.
- FIX – Filter button mode no longer adds unselected checkbox or radio filters to the URL.

VERSION 4.3.0 – 15/07/26

- FIX – Theme Builder header section padding is no longer overridden by Archive Loop custom layout spacing presets on Divi 5 first page load.
- FIX – Select2 dropdown filters keep their normal Select2 look, fill the filter field, and vertically center their text to match text search fields.
- FIX – Custom loop layouts keep their full design on first page load again.
- FIX – Divi 5 Category Loop and migrated custom loop layouts no longer force Divi's backwards compatibility mode on the front end.
- FIX – Opening shop or category page 2+ from the address bar (or a pagination link) shows the correct page on Divi 4 / BodyCommerce Archive Loop, and pagination links stay crawlable and in sync with the address bar after AJAX updates.
- FIX – Map pin tooltips with custom loop layouts open on first page load on Divi 4 and Divi 5 without hanging, including when many markers are shown and when Load layout via AJAX is enabled.
- FIX – Category filters respect Archive Loop include and exclude rules on first load, after reset, and with Hide Empty Values, including correct counts and results when a category is selected.
- FIX – ACF radio filters whose option key ends with "_filter" again show per-choice counts on first page load.
- FIX – Custom Post Meta and ACF Select filters whose values contain a comma (for example "Lastname, Firstname"), and matching filter URLs, again return the correct posts.
- FIX – Archive Loop product sort order stays the same after filtering when sorted by a custom field.
- FIX – ACF number range filters using "From ACF Value (From and To)" use the lowest and highest values from products in the current category or archive.
- FIX – ACF date range filters correctly limit results to the selected date range.

- FIX – WPML String Translation again retrieves translated Archive Loop and filter labels on non-default languages.
- FIX – Archive Loop related mode no longer causes a critical error on sites without WooCommerce when the loop is not using WooCommerce related products.
- FIX – Pagination scroll to top after AJAX page changes works again when Scroll to Top After Ajax Update is enabled.
- FIX – Divi Ajax Filter no longer shows a false update available notice when you already have the latest version or a newer development build.
- FIX – Range filter primary and secondary colors apply on the live page on Divi 4 and Divi 5, including Divi global color variables and Divi 4 color-alpha values.
- FIX – Filter Posts mobile Show/Hide Filter toggle no longer appears on desktop, and the label matches the open or closed state on mobile.
- FIX – Map Filter radius dropdown aligns with other select filters on the front end.
- FIX – Search filter text boxes include custom field values (such as ACF location fields) when filtering directories and other custom post types, not just post titles.
- FIX – Divi Machine Repeater custom loop layouts on Divi 4 again apply section padding and other design settings on first page load.

VERSION 4.2.6 – 29/06/26

- FIX – Sites running Divi Machine and BodyCommerce (or other plugins that bundle Ajax Filter) together no longer show a critical error on page load, and Theme Builder header and footer styling is preserved on archive pages.
- FIX – Post titles in Machine Loop and Archive Loop custom layouts now show each item's title instead of the archive or posts page title (e.g. "Blog"), including Divi's native Post Title module, without affecting Theme Builder header and footer styling.

VERSION 4.2.5 – 29/06/26

- FIX – Divi Machine: Repeater custom loop layouts on Divi 4 now keep section background, padding, and module design on first page load when used with Divi Machine.
- FIX – Filter item field borders on checkbox and radio lists no longer also appear around the outer wrapper that includes the field label.

VERSION 4.2.4 – 26/06/26

- FIX – Archive Loop pages no longer show a critical error when Ajax Filter is embedded in another plugin.

- FIX – Resetting filters after a zero-result search or URL filter load now restores the full post list again, not just the filter options.
- FIX – Custom loop layouts on Divi 5 no longer lose design on the first product in the grid; borders, title styling, and group padding now match the rest of the loop from the first page load.

VERSION 4.2.3 – 24/06/26

- FIX – Custom loop layouts on Archive Loop and Machine Loop now keep their full design—row spacing, padding, module styles, thumbnails, and icons—on first page load, after filtering, load more, and pagination, on Divi 4 and Divi 5 including Theme Builder pages, without slowing or freezing the browser.
- FIX – Custom loop layout Post Title font size and typography are no longer overridden by the Archive Loop Loop Templates blog grid heading style.
- FIX – Theme Builder header and footer keep their design on WooCommerce shop and product archive pages when using Archive Loop with filters.
- FIX – Divi 4 Filter Posts reset button now honours left and right alignment, matching Divi 5.
- FIX – Button icons now display correctly on Divi 5 Filter Posts and Archive Loop buttons (search, reset, mobile toggle, and load more) when enabled in design settings.
- FIX – Checkbox and radio filters with "Display inline" enabled now show options in a horizontal row in sidebar filters, not only in full-width filter bars.

VERSION 4.2.2 – 18/06/26

- FIX – Custom loop layout section, row, and column padding and spacing on first page load now use the same builder-specificity CSS pipeline as filter REST, so Divi theme rules such as `.et-db #et-boc .et-l .et_pb_section` no longer override loop layout design settings before filtering.
- FIX – Machine Loop and Archive Loop custom layouts on Divi 4 now keep their scoped inline styles on first page load instead of stripping them during output sanitization.
- FIX – Font Awesome icons in custom loop layouts now display correctly on Archive Loop listing pages, not only on single post pages.
- FIX – Machine Loop linked ACF relationship fields on the same post type (e.g. tours linking to tours) now show the posts selected on the current page instead of only posts that link back to it.
- FIX – Divi 5 Visual Builder: Ajax Filter modules load correctly on child themes, production builds complete successfully, and image fields open the media library again.

- FIX – Archive Loop and Loop Builder relationship loops no longer return empty results when related posts are stored in a custom field on the current page.
- FIX – Filter Posts (Divi 5): Field Border and margin design settings on the parent module now apply to all filter fields, including select dropdowns and on custom post type archive pages.
- FIX – Filter Posts Target loop container now aims the Divi 5 Loop Builder filter at the chosen loop when several loops are on the same page, including when the CSS ID or class is on a loop item column.
- FIX – Checkbox and radio labels in filter bars stay beside their options on desktop and mobile, including after filter counts load and when Divi Machine styles are active, without overlapping or stacking.
- FIX – Filter options hidden by a zero-result search are restored when you reset filters or change filters to show results again, when Update Filter Count is set to None.
- FIX – Post titles in Archive Loop, Machine Loop, and custom loop layouts now show each item's title and design settings correctly, including when filtering, in carousels, and with Divi's native Post Title module.
- FIX – Price and number range filters work correctly when the page loads with filter values in the URL.
- FIX – Resetting filters on Archive Loop restores the multi-column grid layout instead of collapsing to one column.
- FIX – Custom field images display correctly in Divi 5 loop layouts after filtering.
- FIX – Archive Loop maps show pins correctly with custom marker icons and clustered maps on Divi 5.
- FIX – Range filter color now applies to the full slider bar, not just the handles.
- FIX – Search Posts filter options no longer disappear on pages without an Archive Loop when filter counts load on page load.
- FIX – Custom field range and number filters named with words like "year" now filter by the field value instead of post date.
- FIX – Divi Builder no longer shows a duplicate Ajax Filter extension when BodyCommerce and the standalone plugin are both active.
- FIX – Redis and Memcached settings no longer write repeated errors to server logs when address and port are configured.
- FIX – Filtering works without errors on newer PHP versions.
- FIX – Filter option counts update correctly for all custom field values, including language codes.
- FIX – Product and shop pages with paginated Archive Loops no longer show errors when Initially Loaded Posts Only is turned off.

- FIX – Toggle and collapsible category filters no longer show empty options on load when both "Hide empty options on load" and "Show empty filter options" are enabled.
- FIX – Archive Loop custom loops now return posts from multiple included custom taxonomy categories instead of showing no results.
- FIX – Align Last Module in Archive Loop and Machine Loop custom layouts now aligns only the main loop module at the bottom, not the last item inside repeater modules.
- FIX – Custom loop layouts on Archive Loop and Machine Loop keep button, module, and thumbnail styling on first load, after filtering, and in no-results layouts on Divi 4 and Divi 5.
- FIX – Filter options on single product pages with a related products loop now show all terms from that product pool again, including when Display Current Terms Only is enabled or the filter module renders above the archive loop.
- FIX – Resetting filters on single product pages with a related products loop restores the original related products again instead of showing every product in the shop.
- FIX – Archive Loop (Divi Machine) Post Type setting now shows multi-select checkboxes in the Divi 4 Visual Builder instead of a plain text field with an unsupported-field warning.

VERSION 4.2.1 – 11/06/26

- NEW – Filter Posts now includes a Filter Parameter Location setting so you can choose where active filter tags appear: automatically, above the loop, below the filter, or in a custom container.
- MOD – Thumbnail module preview message now clearly explains when no featured image is available and how to add one or use a placeholder.
- FIX – Filter parameter tags respect the Show Filter Parameters setting, including on Divi 5 Loop Builder pages.
- FIX – Clearing a select dropdown no longer shows the placeholder as an active filter tag.
- FIX – Text search filter tags now appear when enabled and can be removed with the X button.
- FIX – Radio button and colour swatch filter tags stay visible after filtering on Loop Builder pages.
- FIX – Loop Builder no longer clears filter tags from extra background filter requests.
- FIX – Divi Machine: Order By sorting works correctly on Loop Builder when filtering, including text and number custom fields.
- FIX – Fewer unnecessary filter requests run when the sort dropdown changes on page load.
- FIX – Filtering works on the first click when the loop starts hidden with Show Empty on Load.

- FIX – Loop Builder pages no longer load unnecessary filter scripts when only the loop integration is used.
- FIX – Flip-image thumbnails show the correct post in carousel and custom loop layouts.
- FIX – Archive Loop preview in the Visual Builder no longer shows duplicate flip images or broken image placeholders.
- FIX – Custom loop layouts pass the correct post to each loop item module.
- FIX – Loop Builder custom layouts keep module design settings such as post title colour after filtering or load more.
- FIX – Custom loop layout CSS no longer appears as visible text in the Divi 4 Visual Builder.
- FIX – Archive Loop loading animations display correctly when Divi Machine styles are also loaded.
- FIX – Divi Machine gallery sliders in custom loop layouts work correctly after filtering or load more.
- FIX – Archive Loop includes and excludes custom taxonomy terms correctly for posts with multiple terms on load, filter, and load more.
- FIX – Filter dropdowns no longer auto-select a term from the Archive Loop include list on page load.
- FIX – Related posts from the current page now show correctly on Loop Builder relationship loops.
- FIX – Archive Loop shows BodyCommerce wishlist products and Machine Account saved lists when those plugins are active.
- FIX – Related and paginated product loops with Initially Loaded Posts filtering no longer return empty results on page 2 and later.
- FIX – Open in New Tab for link whole grid card works on Machine Loop and Archive Loop Divi 4 pages.
- FIX – Custom no-results layouts on Divi 4 Machine Loop and Archive Loop keep their button and module styles after filtering.
- FIX – Filter Posts reset button alignment works correctly when Search and Reset are stacked or side by side on Divi 5.
- FIX – Divi Ajax Filter settings register in the shared Divi Engine settings hub when Divi BodyCommerce uses the new settings screen.
- FIX – Divi BodyCommerce can be activated when Divi Machine is already active without errors.
- FIX – Divi 5 Visual Builder Ajax Filter and Archive Loop modules load without errors when scripts load in a different order.
- FIX – Filter Posts Item dropdowns load options correctly in the Visual Builder and no longer show empty values after changing a setting.

- LOOP EXTENDER UPDATE
- FIX – Nested relationship loops inside a parent loop now show the correct related items for every parent item, including when you use more than one relationship list in the same layout.
- FIX – Loop Extender now registers in the shared Divi Engine React hub when Divi BodyCommerce is using the new settings screen.

VERSION 4.1.20 – 27/05/26

- NEW – Filter item fields have border settings in Design, matching Divi 4 input borders.
- MOD – Filter Posts and Filter Posts Item content and design settings now use Divi 5's built-in search, with options grouped by tab (Main, Layout, Range, Radio, and more).
- FIX – Post Title modules in Divi 5 Loop Builder and archive loops now show the correct title for each item, including nested layouts.
- FIX – Post Title custom text with dynamic content now resolves correctly inside loops.
- FIX – Excluded categories or taxonomy terms stay excluded on an Archive Loop after filtering on the same taxonomy.
- MOD – Divi Machine: Address and map filters work the same on Divi 4, Divi 5, and Gutenberg.
- MOD – Divi Machine: Address filters search the full place you pick (not partial typing or your browser location), run when expected, and radius searches return matching posts and map pins.
- MOD – Divi Machine: Maps load reliably on refresh, show pins and cluster counts on first load, stay correct after filtering, zoom cleanly, and clear leftover cluster bubbles after click-to-zoom.
- MOD – Divi Machine: Map and listing info windows no longer break when titles or content include special characters such as backticks or apostrophes.
- FIX – On-sale product loops keep showing only sale items after filtering.
- FIX – Changing sort order while logged out no longer repeats the first page of results.
- FIX – Filter field colors, placeholder, and spacing from Divi 4 display correctly after migration.
- MOD – Archive Loop loop template font panels now include margin and padding controls for titles, excerpts, meta, and product text.
- FIX – Archive Loop product title font size now overrides theme styles in the builder and on the live page, same as title color.
- FIX – Thumbnail Design controls (border, shadow, sizing, alignment, overlay) are back; overlay options only show for hover overlay style and no longer cause builder errors when hidden.

- FIX – Date range filters in the builder no longer fail from a missing script.
- FIX – WPML no longer adds duplicate filter strings when you open a translated page.
- MOD – Divi Machine: Archive Loop custom layouts with nested repeaters, tabs, or accordions stay intact after Load More or filtering; card layout stays aligned on first load and after loading more (Divi 4).

VERSION 4.1.19 – 21/05/26

- NEW – Select filters add a Selection mode setting to choose single dropdown or multiselect list.
- FIX – Custom loop layout section, row, and column spacing now uses builder-level selectors only (no extra page-container prefix) so spacing applies correctly after filtering.
- FIX – Custom loop layout styles from filter and load more no longer override theme section padding (for example global `.et_pb_section` padding) after AJAX updates.
- FIX – WPML String Translation no longer creates duplicate entries for the same filter or loop label when pages load in other languages or render more than once.
- FIX – Text search in the filter module now uses Relevanssi when it is installed, so synonym and related-term searches work the same as on the rest of the site.
- FIX – Going back to a shop page after viewing a product no longer leaves category lists stuck showing only the last filtered group; choosing "All" again restores the full list and counts.
- FIX – Choosing "All" or clearing every filter now drops leftover category and taxonomy rules carried in the filter request, so the shop shows every product again and counts stay accurate.
- FIX – After you clear every filter, category and taxonomy choices in the sidebar stay visible with the right counts instead of staying stuck on the last small result set.
- FIX – Category and taxonomy options no longer disappear for good when "hide empty on load" is on and counts widen again after you use the back button or choose "All".
- FIX – Filter options with no matching products now hide correctly on shop pages that use the classic product grid alongside other Divi 5 loops on the same page.

VERSION 4.1.19 – 21/05/26

- NEW – Select filters add a Selection mode setting to choose single dropdown or multiselect list.
- FIX – Category, tabs, and other on-change filters now update results correctly when another Filter Posts module on the same page uses on-click search, including when both modules include a search field (Divi 4, Divi 5, and Gutenberg).

- FIX – Filter counts and results load correctly on pages that mix on-click search with on-change filters.
- FIX – Custom loop layout section, row, and column spacing now uses builder-level selectors only (no extra page-container prefix) so spacing applies correctly after filtering.
- FIX – Custom loop layout styles from filter and load more no longer override theme section padding (for example global `.et_pb_section` padding) after AJAX updates.
- FIX – WPML String Translation no longer creates duplicate entries for the same filter or loop label when pages load in other languages or render more than once.
- FIX – Text search in the filter module now uses Relevanssi when it is installed, so synonym and related-term searches work the same as on the rest of the site.
- FIX – Going back to a shop page after viewing a product no longer leaves category lists stuck showing only the last filtered group; choosing "All" again restores the full list and counts.
- FIX – Choosing "All" or clearing every filter now drops leftover category and taxonomy rules carried in the filter request, so the shop shows every product again and counts stay accurate.
- FIX – After you clear every filter, category and taxonomy choices in the sidebar stay visible with the right counts instead of staying stuck on the last small result set.
- FIX – Category and taxonomy options no longer disappear for good when "hide empty on load" is on and counts widen again after you use the back button or choose "All".
- FIX – Filter options with no matching products now hide correctly on shop pages that use the classic product grid alongside other Divi 5 loops on the same page.

VERSION 4.1.18 – 14/05/26

- NEW – Archive Loop (Divi 5 and Gutenberg): when using pagination, the address bar uses the usual page segment for your content type, or you can set your own segment in module options so several loops on one page can each keep a different page number—without short unfamiliar keys in the link.
- MOD – Archive Loop (Divi 5 and Gutenberg): you can style the No Posts Text message from the Design tab (font, background, border, color, alignment, and text shadow).
- MOD – Compatibility between Divi Ajax Filter, Divi Machine and BodyCommerce, improved common code.
- FIX – When a page has several Archive Loops with different custom pagination segments, changing one loop's page no longer resets the others after you refresh the page.

VERSION 4.1.17 – 14/05/26

- NEW – Divi 4 shop-style Archive Loops add Show Categories and Show Tags settings.
- NEW – Filter Posts Item adds a Published Date filter in Divi 5 and Gutenberg, with a single date or a date range.
- MOD – Archive Loop blog grid cards keep overflowing content clipped inside each item for a cleaner layout.
- MOD – Divi 4 shop-style product loops hide product tags until you turn Show Tags on.
- MOD – The plugin checks for updates less often in the admin.
- MOD – Temporary logging used while fixing the admin updates notice was removed.
- MOD – Translation tools such as Loco Translate can find and load language files; release packages include an updated translation template.
- MOD – Grid and list switches and reset links have clearer labels for screen readers.
- MOD – Date range pickers offer quick choices such as Today, Last 7 days, This month, and All time, while still allowing calendar selection.
- MOD – Optional troubleshooting mode from the page address stays on for the rest of the visit after visitors use reset.
- FIX – Shop archives that only show in-stock products keep correct counts and stock rules after clearing filters or using reset.
- FIX – Archives limited to a brand or similar scope stay within it when visitors add another filter.
- FIX – Load more on filtered shop archives continues through the full matching set.
- FIX – New filter choices return to the first page so you do not see an empty list after paging ahead.
- FIX – Filtered lists keep the same spacing and layout as the first view, including Theme Builder loops and custom archive columns.
- FIX – Divi 5 Loop Builder shows the right custom field lists in the builder and keeps filtered results correct when items use fields tied to categories or tags.
- FIX – Divi 5 Filter Posts Item conditional logic lists other filters reliably and no longer breaks the builder preview when you pick a field.
- FIX – Category, tag, and taxonomy options on Search Posts stay complete when the page setup gives little context.
- FIX – Variable products stay hidden as expected when combining attribute filters with "always hide out of stock."
- FIX – Filtering and pagination keep working when a currency switcher changes the page address.
- FIX – Published Date filters show the picker on the page, and the reset control appears when it should after a date change.
- FIX – Divi 5 shop product thumbnails line up cleanly with image overlays.

- FIX – Divi Ajax Filter and Divi Machine can run together without one blocking the other.
- FIX – Theme Builder layouts, maps, and filtered results keep matching styles on the live page after filtering or load more.
- FIX – After opening a filtered link, refreshing, and using Reset, filter counts match the cleared page again.
- FIX – A static home page with an Archive Loop no longer shows the wrong content when reloading with a page number after pagination.
- FIX – The WordPress Updates screen can show Divi Ajax Filter updates again.
- FIX – Update checks read version and download details from the server when they are returned outside the short status line.
- FIX – Turning off result caching in plugin settings now stops cached filter, load more, and count responses for visitors.
- LOOP EXTENDER UPDATE
- MOD – Relationship filters can now connect category pages and custom post type loops in both directions when using ACF/SCF relationship-style fields.
- FIX – Taxonomy field selections can now be used in relationship filters to show the correct custom post type items on matching term archive pages.

VERSION 4.1.15 – 04/05/26

- NEW – Filter Posts: use the same compact filter bar on tablets and phones (turn it on under Mobile Settings).
- MOD – Archive loop sections and rows keep the same builder-level styling after filters or page changes as on first load, matching scoped columns.
- FIX – Map pages no longer act up when the map redraws pins after visitors change their filter choices.
- FIX – Tick boxes and multi-choice lists now match what visitors actually picked, even on long pages with several filters in play.
- FIX – Custom field filters work the same with or without Divi Machine installed.
- FIX – On filtered category and tag pages, going to the next page or using load more keeps the right results, keeps your layout looking right, and Divi Machine text inside the list stays correct when people filter again.
- FIX – Filter Posts multi-choice lists show the text you set for an empty list, load smoothly, and can open upward when there is little space below.
- FIX – Search Posts lists match your other inputs, and multi-choice boxes are no longer cut off at a short height.
- FIX – Divi 5: if a loop is sorted by a custom field or a date, the settings to pick that field show again in the builder when Divi Ajax Filter is on.

- FIX – Archive Loop: the space between rows and columns on the live site now matches what you set in the builder.
- FIX – Divi 5 Filter Posts: labels for the mobile show/hide switch stay under Mobile Settings like Divi 4, instead of only showing when the preview is squeezed to phone size.
- FIX – After filtering categories or tags, page two and onward no longer show the wrong posts.

VERSION 4.1.14 – 28/04/26

- NEW – Multilingual sites: Dynamic Strings can be translated.
- MOD – Added a new Layout Rendering Mode: keep Standard mode for the fastest results, or switch to Compatibility mode if you have rendering issues.
- MOD – Added tags visibility settings for Divi Shop Style Loop Template.
- MOD – Filter Posts now includes an out-of-stock visibility setting so you can inherit WooCommerce behavior, always hide out-of-stock products, or always show them in filtered results.
- MOD – Divi 4: the out-of-stock filtered-results setting is now available in Main Content options for easier access.
- MOD – ACF field setup now runs with fewer repeated background lookups on busy loop pages.
- FIX – Divi Loop Builder Ajax Filter, interactions working now (hover etc)
- FIX – Variable product filters now hide sizes and options that are out of stock when you set out-of-stock visibility to always hide.
- FIX – Archive Loop (Divi 4 → 5): Column counts and the ACF field used for “linked posts” now carry over when you migrate a layout to Divi 5.

VERSION 4.1.13 – 22/04/26

- MOD – Archive Loop (Divi 5) map markers: use the same field source as the Map module when possible (including ACF with Meta Box and similar), respect empty “map post type” as “all types,” and read the map pin’s Custom Field from the layout when the global option is not set.
- NEW – Filter Posts (Divi 5 Loop Builder): Target loop container (main options) lets you aim the filter at one loop when several are on the page; leave it blank and the plugin picks the archive area when present, then matches Filter post type when possible, then the first suitable loop.
- NEW – Multilingual sites: you can now translate custom filter text across Divi 5 modules, Divi 4 modules, and block editor modules using WPML String Translation.

- MOD – Filtered archive links now load correctly from common `?filter=` URL values, not only one exact value.
- MOD – Numbered archive pages now work when the page number comes from the URL path.
- FIX – Filter Posts buttons in Divi 5 now keep their intended button styles instead of being overridden by Theme Customizer button colors.
- FIX – Divi 5 custom loop layouts now keep consistent styling and global colors across filtered and loaded content.
- FIX – Loop Builder custom meta text now stays visible after Ajax filtering.
- FIX – Filter parameter tags now stay hidden when disabled and now clear translated dropdown filters correctly.
- FIX – Hover and interaction effects continue working on loop items after filtering.
- FIX – Divi 4 to Divi 5 Archive Loop migration now keeps column counts and linked-post field settings more reliably.
- FIX – Divi 4 to Divi 5 Archive Loop migration now avoids missing style and admin label settings during conversion.
- FIX – Numbered pagination and Load More no longer repeat posts across pages.
- FIX – Archive Loop no longer causes a critical error on some shop and product search pages.

VERSION 4.1.12 – 16/04/26

- FIX – Thumbnail modules upgraded from Divi 4 to Divi 5 now open as real modules instead of leftover shortcode text, including older saves that used extra builder placeholders.
- FIX – Post Title modules upgraded from Divi 4 to Divi 5 now convert cleanly instead of showing as raw shortcode on the page.
- FIX – Archive Loop (Divi 4 → 5): Layouts with product grids, load more, and multi-column settings convert more reliably when you move from Divi 4 to Divi 5.
- FIX – Custom loop layouts in Divi 5 now show theme and global colors correctly when the loop is the main content on the page.
- FIX – Category, tag, and taxonomy filter options stay available in the builder and on the live site when a taxonomy is missing or invalid, instead of causing an error.
- FIX – Archive Loop custom layout preview in the builder now matches the front-end column layout without an extra wrapper around the grid.
- FIX – Load more uses the same layout styling as filtering when you use a custom loop layout, so newly loaded items match the rest of the grid.
- FIX – Taxonomy filters on category and tag archive pages no longer apply the same condition twice.

- FIX – WooCommerce Wholesale Prices: Wholesale pricing stays correct after you filter or sort the shop.
- FIX – Archive loops that mix more than one content type now return the right posts when you filter by a taxonomy that applies to those types.
- FIX – Custom loop layouts keep their styling when you open the same page again, instead of sometimes looking unstyled until the style cache refreshes.
- FIX – Archive Loop (Divi 5): Map tooltips that load via AJAX with clustering on now wait for the final map instance and rebuild the cluster after the AJAX response (same pattern as non-AJAX); saved-layout tooltips use loop post context when `daf_with_map_loop_post_context` is available; tooltip shortcode fallback uses the correct setting variable.

VERSION 4.1.11 – 14/04/26

- NEW – (Divi 5) Filter Posts: Target loop container (main options) lets you aim the filter at one loop when several are on the page; leave it blank to auto-detect.
- NEW – (Divi Machine) Filter Posts Item with Divi Machine: Custom-field filtering in the Visual Builder and on live pages now works with Meta Box, Pods, Toolset, ACPT, and similar field setups when one of those is your active source; with Ajax Filter only, behaviour stays the same as before for Advanced Custom Fields and Secure Custom Fields.
- MOD – (Divi 5 & Divi Machine) Archive Loop: Map and cluster added for divi machine plugin.
- MOD – (Divi Machine) Filter Posts Item (Visual Builder): The field picker under custom fields now says “Custom field” when you are not using ACF or Secure Custom Fields, so the wording matches the main filter type option.
- MOD – Divi 5 Visual Builder loads all module scripts from the main builder file again instead of separate script files.
- FIX – Archive Loop (Divi 5): Layouts converted from Divi 4 that set a custom loop layout but did not save a loop style no longer lose the selected layout in the builder; migration and Visual Builder sync now treat that case as custom layout mode.
- FIX – Date range filters no longer show a type error for simple date field types that are not named “date picker” or “date time picker.”
- FIX – Divi Engine license REST routes no longer trigger a fatal error when two active plugins each load their own copy of the shared license settings file.
- FIX – Loop Builder filter (Divi 5): Hover and visibility interactions on filtered loop items use Divi’s own interaction setup and correct loop scoping, so they behave like the page before filtering.

- FIX – Filter Posts Item (Divi 5): Product price filters now show range content and design options in the builder when the filter type is a dropdown, matching how the price control appears on the page.

VERSION 4.1.10 – 03/04/26

- MOD – Shared `common/Shared/rest-calls` routes (get-categories, get-tags, get-taxonomies, get-taxonomy-terms, get-products, get-divi-layouts, get-post-types, get-taxonomy, get-taxonomies-checkbox) are registered under **divi-machine/v1** as well as **divi-ajax-filter/v1**, matching Divi Machine Visual Builder requests without changing handlers.
- FIX – Archive Loop (Divi 5): `daf_merge_constraining_query_vars_for_filter` is called as a global function in the renderer (`daf_merge_…`) so namespaced PHP does not resolve it inside `DEAFModulesArchiveLoop`.
- FIX – Thumbnail (Divi 5): Overlay icon font styles use a closure for `declarationFunction` so Divi's style layer always treats the callback as callable; `DE_D5_Callback` is registered with a namespaced `class_exists` check so a global `DE_D5_Callback` class cannot block the real class. Icon and color attrs are normalized for migrated layouts (CSS/text/height/align arrays, scalar overlay colors only).
- FIX – Thumbnail (Divi 5): `module_styles` now sets `$settings` from the style callback args so module visibility and overlay icon styles run without an undefined variable (overlay icon keeps the `content` property required by Divi 5's icon styles).
- MOD – Settings sidebar shows section icons and can be collapsed to give more room for options; your choice is remembered.
- MOD – Divi 5 Thumbnail module now works in the loop builder context.
- FIX – Divi Engine license REST routes no longer trigger a fatal error when two active plugins.
- MOD – Divi 5 modules would not load some times when slower network.
- FIX – Pages with several post loops now keep pagination and filtering on the intended main loop instead of updating a different loop on the page.
- FIX – Custom loop layouts used inside Archive Loop now keep theme and preset text and button colors on the live page instead of looking unset.
- FIX – Posts loaded with Load More now keep the same column and gutter layout as the first page instead of shifting to different column styling.
- FIX – Load More responses now always rename section and row classes in bundled CSS even when the page index is missing from the request, so global Divi selectors are not injected into the page.

- FIX – Pages with more than one Load More module no longer share the same injected layout styles, so visibility rules from one loop no longer hide items in another loop.
- FIX – Number custom fields in loop Text modules no longer show a wrong January 1970 date after filtering when the layout still has date formatting options enabled.
- FIX – URL system parameters (like preview and page ID) no longer get treated as filters, preventing first-click filter requests from showing no results.
- FIX – Pages that use the Divi 5 Thumbnail module inside a Group loop no longer crash on the frontend.
- FIX – Category and tag filters now behave reliably when you use button or checkbox styles instead of a dropdown.
- FIX – Divi 5 Filter Posts now loads filter scripts on the live page when no Archive Loop is on the layout, so filters work the same as with a loop module present.

VERSION 4.1.9 – 26/03/26

- FIX – Load More no longer fails with a browser console error when other plugins load a second copy of jQuery.
- FIX – Ajax Filter now keeps the correct settings mode when BodyCommerce, Mobile, Nitro, or Protect is active.
- FIX – Theme Builder header and footer now display correctly on product category pages when Divi 5 Archive Loop is used.
- FIX – Divi 5 Archive Loop now loads normally on pages without a Filter module and no longer runs into timeout errors.
- FIX – Custom loop layouts that use shortcodes or embeds with inline scripts (such as flip-book viewers) no longer break those scripts after filtering or loading more posts.
- FIX – Divi 5 button-style radio and checkbox filters now hide the default icon so only the button labels are shown.
- FIX – Plugin update checks now register correctly so new versions show up under Plugins when available.
- FIX – Pagination on filtered search (e.g. page 2) now keeps category and URL-based filters.

VERSION 4.1.8 – 19/03/26

- FIX – Divi 5 Loop Builder now removes any incorrect zero sale amount from filtered non-sale products while keeping valid prices visible.
- FIX – Archive Loop no longer triggers PHP warnings on shop and archive pages, preventing high CPU usage from error logging.

- FIX – Load More no longer shows duplicate posts on the second click after filtering, especially for custom post types.
- FIX – Divi Machine Loop and Divi 5 Archive Loop now include REST nonce data for AJAX requests, helping logged-in membership content stay in sync during filter and load more actions.

VERSION 4.1.7 – 17/03/26

- FIX – ACF filters now apply correctly on the initial page load for WPML-translated sites with localized URL parameters.
- NEW – Filter Posts "Update filter count" setting now has three options: update all counts, do not update the selected filter group, or do not update any counts.
- FIX – Divi 4 Ajax Filter – On Sale filter no longer causes errors when WooCommerce or sale-booster plugins are not active.
- FIX – Improved Divi 5 style loading so Ajax Filter keeps required form styles without affecting Divi caching across the whole site.
- FIX – Divi Loop Builder – CSS priority was being overwritten so styles were messed up after filter
- FIX – Divi 5 Archive Loop now shows posts on initial page load instead of an empty grid.
- FIX – Load More and Infinite Scroll now keep the correct custom post type on archive loops instead of switching to regular posts.
- FIX – Hyphenated values now stay correct across acf, category, select, and radio filters while date ranges continue to normalize correctly.
- FIX – Divi Machine – Text search terms in filter URLs now stay active during AJAX filtering, so keyword searches can return matching ACF field results.
- FIX – Divi Machine – ACF keyword search now stays attached during AJAX filter requests, preventing empty results when matching posts exist.
- FIX – Load More now keeps loading all available custom post type results instead of stopping early on long lists.
- FIX – Divi Machine map pins now stay in sync after Load More and Reset, so the map matches the posts shown in the loop.
- FIX – Load More -after Reset now stays within the current category or taxonomy archive instead of showing items from all categories.

VERSION 4.1.6 – 12/03/26

- MOD – On brand-new pages with WooCommerce active, Archive Loop now starts with Product post type and Shop template by default while keeping existing saved module choices unchanged.

- FIX – Applying a filter after using Load More no longer shows "no results"; the first page of filtered results now displays correctly.
- FIX – Load More no longer shows duplicate posts when clicking multiple times.
- FIX – Sorting now correctly re-sorts all products after using Load More, instead of only showing a partial page of results.
- FIX – Show More / Show Less for limited filter lists now works on all sites, even when other scripts intercept clicks.
- FIX – Archive Loop now keeps your saved loop template selection after reload, so custom templates no longer switch back to Blog or Shop views.
- FIX – Opening Main Settings in Divi 5 Visual Builder no longer resets the saved loop template back to default choices.

VERSION 4.1.5 – 09/03/26

- MOD – Changed the name for Filter type from "Search" to be "Text Search"
- FIX – Select2 (dropdown) filters now placed correctly inside filter module, eliminating overflow issues with WooCommerce.
- FIX – Date picker now works correctly with sticky filters: the calendar stays aligned when scrolling and appears above other content instead of underneath.
- FIX – Date range filters now stay visible in Archive Loop when "Hide Filter Item When it has no options" is enabled.

VERSION 4.1.4 – 05/03/26

- MOD – Divi 4 Archive Loop now includes custom text settings for single, all, and paginated result counts, and Load More uses those custom labels.
- MOD – On hosts without Redis, the plugin now does a one-time fast check and remembers the result for 24 hours, so filter and load more stay fast with no multi-second delay.
- */FIX – Date range filter in the Loop Builder now correctly finds matching posts for all ACF date field types; date values in the URL stay valid for all formats.
- FIX – Result count now displays correctly after resetting filters, loading more, and on paginated loops (archives, posts, custom post types, and WooCommerce products).
- FIX – Filters on category and taxonomy archive pages now correctly restrict results to the current category or taxonomy.
- FIX – Out-of-stock products now display consistently during filtering when Stock Status is set to show all; stock status filter no longer hides other filters.
- FIX – Pagination and Search Posts filters now show the correct filtered results across all pages; category, tag, and custom field filters apply correctly.

- FIX – Divi 5 Loop Builder dates keep the same display format after AJAX filtering, including custom date fields.
- FIX – Divi 5 sites no longer crash when both Divi Loop Extender and Divi Ajax Filter are active together.
- FIX – Divi 5 Filter Posts no longer breaks page layout when Toggle appearance is used without a saved toggle start setting.
- FIX – WooCommerce result count keeps the site's language and left-aligned layout after AJAX filtering and Load More; translated result count text is preserved.
- FIX – Child category selections in collapsible checkbox filters now show the selected filter tag correctly.
- FIX – Search button clicks now reliably trigger filtering in button-click update mode.
- FIX – Checkbox filters now correctly support "Multiple Select Relation = AND" so selecting multiple taxonomy options matches products that meet all selected terms.
- FIX – Divi 5 Limit Height now works correctly for checkbox and radio filter lists; Show More/Show Less expands and collapses as expected.
- FIX – Divi 5 Load More now works reliably: button no longer duplicates or disappears incorrectly, filters stay applied when loading more, and visibility stays in sync after reset.
- FIX – Product price range filters now always use a valid min and max from your store, so the slider no longer gets stuck at one value.

VERSION 4.1.3 – 27/02/26

- NEW – Divi 5: Horizontal and vertical spacing settings for radio/checkbox when Inline is enabled, so you can control spacing between options and between rows.
- FIX – Date range filters (datepicker) no longer stay hidden on load when "Hide Filter Item When it has no options" is enabled; they are now always shown like number range filters.
- FIX – After resetting filters, the text search term is now cleared so the loop shows all posts again instead of staying filtered by the previous keyword.
- FIX – Category and other checkbox/radio filter options now add URL parameters correctly when the option label or value uses different capitalization; filter state also restores correctly when loading a page with capitalized values in the URL.
- FIX – Divi 5: Inline radio/checkbox spacing now uses margin so it works correctly with inline-block layout.
- FIX – Load More now correctly tracks already shown items on more loop layouts, so repeated clicks no longer re-show the same posts.
- FIX – Select filters now apply immediately when the chosen option includes special characters, and no longer wait for another filter click to update results.

- FIX – Taxonomy filters now treat uppercase and lowercase term values the same when applying filters
- FIX – [Loop Builder] Filter Paramaters would not show capitalized terms
- FIX – Date range filters now correct malformed year values in URL parameters (for example `03/04/262026` now becomes `03/04/2026`) so date filtering works reliably.
- FIX – Loop Builder datepicker filters now use the correct date filter handler (instead of range slider handling), so selected date ranges are applied properly.
- FIX – Loop Builder ACF date range filters now apply the selected start/end period correctly (date ranges now use a proper between match instead of exact match).
- FIX – Date range filters set to update on change now wait for both dates before filtering, so results no longer update after selecting only the first date.
- FIX – Date range filters set to update on submit now only run when you click the search button; selecting dates no longer triggers the filter until you submit.
- FIX – Product titles now stay correct after AJAX filtering when other access-control plugins are active.
- FIX – Archive loop no longer triggers a PHP notice when the loop contains non-product posts or products that are not purchasable.
- LOOP EXTENDER UPDATE
- MOD – Added support for the Exclude Current Post setting in Divi 5 loop queries.
- NEW – Support for nested loops: Related products/related posts now work correctly when a loop is nested inside another loop. The nested loop will now use the post ID from the parent loop to show related content.

VERSION 4.1.2 – 24/02/26

- ENHANCEMENT – Divi 5 Visual Builder: Module scripts now load in separate chunks for faster initial load; modules still appear correctly when opening the builder or navigating without a hard refresh.
- MOD – Security and marketplace compliance: legacy settings and AJAX handlers now sanitize form and request input as required by the Elegant Themes PHPCS ruleset.
- MOD – Divi 5 Loop Builder: Date range filter input now shows a human-readable date range (e.g. "18 Feb 2026 – 25 Feb 2026") instead of the raw numeric format (YYYYMMDD – YYYYMMDD); the value sent to the server is unchanged.
- FIX – When ordering by price (or other sort option), product loop no longer shows out-of-stock items: filter and loadmore endpoints now always apply WooCommerce "hide out of stock" and exclude-from-catalog so sorted/filtered results match the shop catalog setting.

- MOD – Divi 5 Visual Builder: Module scripts now load in separate chunks for faster initial load; modules still appear correctly when opening the builder or navigating without a hard refresh.
- FIX – Related posts loops using an ACF Post Object field no longer crash on PHP 8 when the field is set to a single post type.
- FIX – Filter and load more results now respect role-based or user-specific pricing when caching is enabled; prices no longer revert to default after sorting or filtering.
- FIX – Text search on loops that show private (or other non-publish) posts now returns the correct results; the filter no longer forces "published" only when your loop is set to show private or custom statuses.
- FIX – Searching by title or keyword now works when a date-of-birth (or other date) filter is on the same form: the date is only sent when the user has actually selected a date. If the date field is empty (or only shows a placeholder), it is no longer added to the filter request, so search-only returns the correct results.
- FIX – Search results pages (e.g. from Search Posts module): the filter is no longer run via AJAX on page load, so the server-rendered results stay visible and the URL is not changed (e.g. the search parameter is no longer removed).
- FIX – Map radius filter now reads address and radius from the filter state (decoded query / data-filter-var) when not sent as top-level request params, so searching by place name (e.g. "Cagliari") correctly limits results to that area.
- FIX – Map radius filter now correctly limits results to posts within the chosen distance of the search address or centre point; previously all posts were shown regardless of radius.
- FIX – Divi 4: "map_radius is not defined" error when using the address/map radius filter is resolved; filter button and URL params now work correctly.
- FIX – Conditionally hidden filter items (e.g. range slider shown only when "Metros" or "PSI" is selected) now stay hidden on initial load instead of briefly reappearing after filter counts load.
- FIX – On product category (and other taxonomy) archive pages, filtering by a shared attribute (e.g. product tag) now limits results to the current category (and its subcategories) instead of showing products from other categories.
- FIX – Filter and load more no longer hang or run slowly on hosts without Redis. Cache now skips Redis/Memcached when disabled via wp-config and uses a short connection timeout so requests do not block.
- FIX – Divi 5 Loop Builder: Date range filters (datepicker) now filter correctly; the server now accepts both "min – max" and "min;max" range formats so date filters are applied to the loop query.

- FIX – Divi 5 Loop Builder: Date range display now clears after Reset and updates correctly when you pick new dates in the datepicker (previously the display could still show the old range).
- FIX – Divi 5 Loop Builder: Fixed page crash when choosing a date in the date range picker; removed observers that could interfere with the datepicker and debounced layout updates.
- FIX – Load More button no longer disappears after the first click when using BodyCommerce with Divi 4; the button now stays visible until all pages are loaded.

VERSION 4.1.1 – 12/02/26

- MOD – Security and ET Marketplace compliance: validated all superglobal (e.g. $_POST, $_GET) access with isset() before use; updated get_terms() to current WordPress signature; MemberPress compatibility now only bypasses protection when the user is logged in and no specific post is being checked.
- FIX – "Hide Filter Item When it has no options" now hides the entire filter (including label) when there are no options; previously the label could still show. Divi 5 Loop Builder: also hide the wrapper column when present so the whole filter item is hidden.
- *

VERSION 4.1.0 – 06/02/26

- NEW – New setting to disable "Enhanced Load More" – disable this if you are experiencing issues with load more to not use our enhanced code. We have merged our code with filter to enhance the compatiability and make sure results are consistent.
- MOD – Load More: Improved ACF field support and query handling for better consistency with filtering.
- FIX – Load More now uses the correct loop layout after changing from Custom Loop Layout to Loop Template (or vice versa).
- FIX – WooCommerce sort dropdown now correctly reorders products when changing sort order (e.g. price low to high).
- FIX – Changing sort order now keeps all loaded products when using Load More instead of resetting to the initial page count.
- FIX – Load More (Divi 4) no longer repeats the same posts; each click now loads the next page correctly. Fixes the loadmore script (divi-filter-loadmore.js) sending a valid page number and the REST endpoint reading page from the JSON body when needed.
- FIX – Load More (Divi 4): Duplicate products on "Load more" fixed by sending already-displayed post IDs with each request; the server returns the next batch that excludes

those IDs so no product appears twice even when the first page shows more than the module's Post Number.

- *

VERSION 4.0.21 – 04/02/26

- NEW – Toggle filter setting: Choose how filter sections start when using Toggle appearance—First Option Open, All Closed, or All Open (D4, D5, Gutenberg). First Option Open is the default.
- NEW – MemberPress compatibility: AJAX filtering and sorting now works correctly with MemberPress-protected content. Users with valid memberships can now filter and sort content without seeing "access denied" errors.
- FIX – URL parameters now correctly removed when "All" option is selected in filter options.
- FIX – Load More: Grid layout no longer breaks after loading more posts. Fixed missing grid wrapper divs and inline style tags that were disrupting CSS Grid.
- FIX – URL parameters now correctly removed when "All" option is selected in filter options.
- FIX – Filter & Load More: Grid layout no longer breaks after filtering or loading more posts. Fixed inline style tags that were disrupting CSS Grid.
- FIX – Only one Divi Engine menu now appears in the admin when multiple Divi Engine plugins (e.g. Ajax Filter, Form Builder, Mobile) are active.
- FIX – Post Object Relationship: Source ACF Field dropdown now shows all ACF fields for both forward and reverse directions, fixing cases where the field was on a different post type than the loop's selected post type.
- FIX – Archive Loop Post Object Relationship: Loop now correctly displays only the selected posts from an ACF Post Object field instead of showing all posts.
- FIX – Resetting filters now shows all filter options again; previously options that were hidden (zero count) stayed hidden after reset.
- FIX – Grouped results now show correctly again after resetting filters.
- FIX – Grouped results now keep the correct order after filtering, resetting, and loading more.
- FIX – Grouped results now keep the correct order when sticky posts are enabled.
- *

VERSION 4.0.20 – 28/01/26

- FIX – Archive Loop masonry layout now reinitializes correctly after pagination & load more

- *

VERSION 4.0.19 – 27/01/26

- FIX – WPML/Polylang Compatibility: Load more and infinite scroll now correctly show only posts in the current language instead of duplicating posts from all languages.
- FIX – Filter Posts module now hides properly when all items and buttons are hidden (no vertical space occupied).
- FIX – Checkbox filter values containing special URL characters (ampersands, equals signs, etc.) now correctly encode in URLs and filter properly.
- FIX – Third-party Divi modules (BodyCommerce, etc.) now render correctly after filtering or load more instead of showing as raw shortcodes.
- FIX – Divi 5 Loop Builder: Related posts display no longer causes a fatal error when post type is not set in query arguments.
- FIX – Post Object Relationship (Reverse Direction): Source ACF Field dropdown now shows all ACF fields from all post types when using "To this post" direction.
- *

VERSION 4.0.18 – 22/01/26

- FIX – Divi 5 Loop Builder: ACF select fields with "Allow Multiple Values" enabled now filter correctly.
- FIX – Divi 5 Loop Builder: Selecting multiple filter options now correctly finds matching posts.
- FIX – Divi 5 Loop Builder: Animations & interactions (including rotate, scale, tilt effects) after AJAX filtering.
- FIX – Divi 5 Beta 7+ compatibility: ACF/custom fields in custom loop layouts not rendering after filtering.
- FIX – Toggle filter arrow icon now points upward when filter is open/expanded.
- FIX – SearchWP Compatibility: Infinite scroll/load more now returns correct posts when SearchWP plugin is active.
- FIX – Archive Loop Masonry: Multiple masonry loops on same page not initializing correctly – second Archive Loop was breaking.
- FIX – Divi 5 Loop Builder: WooCommerce modules (price, add to cart, title, rating, etc.) not rendering after AJAX filtering.
- FIX – Divi 5 Loop Builder: ACF array values displaying as JSON (e.g., `["Sound Snacks"]`) instead of readable text. Array values are now formatted as comma-separated strings.
- MOD – FOX/WOOCS Currency Switcher compatibility: Product prices now display in the correct currency after filtering and load more. Requires FOX Currency Switcher to be

active.

- FIX – Multi-select OR filter returning no results when ACF filter present – Fixed incorrect delimiter when parsing filter values causing count mismatch between filter names and values.
- FIX – Filter Counts: Fixed counts showing 0 for ACF field filters – JSON parsing was failing due to malformed escaped quotes in filter values, and taxonomy filters were not being preserved for the count query.
- FIX – Hierarchical taxonomy filtering: Filtering by parent and child category together (e.g. Audi + A4) now correctly shows matching products instead of returning all products.
- FIX – URL Filter Parameters: Fixed issue where reloading page with URL filter parameters would not show correct filtered products.
- FIX – Infinite Scroll: Layout CSS breaking on 2nd+ scroll – Fixed styles for previously loaded products being removed when loading more posts.
- FIX – Infinite Scroll: Price sorting not working – Products loaded via infinite scroll were not respecting the price sort order.
- FIX – Load More: Posts loading in wrong sort order – Fixed sorting not being applied for non-WooCommerce post types.
- FIX – Archive Loop: Button styling in Loop Templates not applied after AJAX filter.
- FIX – Divi 5 Loop Builder: WooCommerce products (and all posts) failing to render after AJAX filtering.
- FIX – Divi 5 Loop Builder: Dynamic links not working after AJAX filtering.
- FIX – Link Whole Layout: Clicking on thumbnail module now correctly navigates to the post URL instead of opening the image URL.
- FIX – Loop Builder Ajax Filter: ACF select field filters showing no results.
- FIX – Filter Counts: "All" count showing total posts instead of posts with values.
- *

VERSION 4.0.17 – 13/01/26

- NEW – Divi 5 Custom Loop Layout: Full Dynamic Content support. Custom Divi Library layouts used as loop templates now fully support Divi dynamic data (ACF fields, post meta, post title, etc.)
- FIX – Range/Number filter items being hidden on load – Range and number filter types (ACF range fields, product price, etc.) were being incorrectly hidden when "Hide Filter When Empty" was enabled. Range filters don't have discrete options to count like radio/select filters, so they should always be visible. Fixed in both Loop Builder and regular filter systems.

- MOD – `divi_filter_completed` js trigger after Loop Builder Filter – same as archive loop filter.
- FIX – Duplicate get_count API calls causing incorrect filter counts – Fixed issue where both old and new loop builder systems were calling show_filter_counts() simultaneously.
- FIX – Missing query parameter in get_count API calls.
- FIX – Divi Loop Builder: CSS styles breaking after filtering. After filtering, element classes like `et_pb_text_4`, `et_pb_image_0` were getting duplicated across multiple elements, causing CSS conflicts
- FIX – Divi Loop Builder: Multiple filter modules on same page not working.
- FIX – Toggle filter style: First filter item could not be closed.
- FIX – Raw CSS was showing in Archive Loop sometimes.
- FIX – Divi 4: Post Title module showing post title instead of taxonomy title in Category Loo.
- FIX – PHP warning "Undefined variable $orderby_filter" when using offset with non-native sort fields.
- FIX – OrderBy module ACF field sorting not working – When using the OrderBy module with ACF fields, sorting was not applied because the code didn't recognize ACF field names as meta keys.
- FIX – Load More: Custom map marker icons reverting to default Google pins after load more, and marker labels (letters) appearing on old pins.
- FIX – Load More: Loop layout CSS styles not rendering correctly after load more.
- FIX – Divi 5: Map pins not updating on filter.
- FIX – Load More: "Hide Marker Label" setting not working.
- *

VERSION 4.0.16 – 19/12/25

- FIX – Sorting & filtering not working when exclude categories were added in the archive loop
- FIX – Checkbox Divi Style click area was not over whole word
- *

VERSION 4.0.15 – 19/12/25

- FIX – Divi Loop Builder Integration: Custom fields not returning on AJAX-filtered items properly
- FIX – Cache functions: Added class existence checks before instantiating Redis and Memcached classes to prevent fatal error.

- FIX – Post type detection priority: Fixed post_type detection to prioritize `data-posttype` attribute from `.main-loop` div (highest priority). The JavaScript now reads `data-posttype` from the archive loop module and sends it as `posttype` parameter. The REST endpoint checks this parameter FIRST before checking query args, query param, loop_var, etc. This fixes issues where filtering defaults to "post" instead of the correct custom post type (e.g., "listings") on regular pages. Detection order: data-posttype attr → query args (decoded) → query param (raw) → loop_var → initial_post_ids → fallback to "post".
- FIX – Infinite scroll not working: Fixed infinite scroll (load more on scroll) not working. The issue was that the loadmore REST endpoint was not using the `posttype` parameter to set `post_type` in the query args, causing it to default to "post" and return no results for custom post types. Now the endpoint properly sets `post_type` from the `posttype` parameter when it's not already in the decoded query. Also fixed infinite scroll handler re-initialization after filtering completes via the `divi_filter_completed` event, and improved container detection to properly find `.loop-grid` inside `.divi-filter-archive-loop` for appending new posts.
- FIX – MutationObserver error handling: Improved error handling for MutationObserver when observing range slider inputs to prevent "parameter 1 is not of type 'Node'" errors in console.
- FIX – Hide Rest Button was not being hidden
- FIX – Loop Builder Filter ACF fields was not working
- FIX – Divi Loop Builder: ACF checkbox field filters returning no results – ACF checkbox fields store values as serialized arrays in the database, so the meta query now uses LIKE comparison with quoted values instead of exact equals. This allows the filter to properly match checkbox field values stored in serialized format. Also supports comma-separated values for multiple checkbox selections.
- FIX – Divi Loop Builder: Column structure getting messed up after filtering returns no results – When filtering returns no results and then resetting, the column class structure (et_pb_column_2, et_pb_image_0, etc.) was being replaced with different class names (et_pb_df_ajax_filter_column_0_p234, etc.). Now captures the original structure on first load and restores it on subsequent renders, preserving the original class naming pattern and flex column classes even after filtering returns no results.
- *

VERSION 4.0.14 – 17/12/25

- NEW – Performance Timing Debugging: Added comprehensive performance timing measurements for filter and get_count requests. Server-side timing tracks database

queries, layout rendering, CSS generation, and response preparation. Client-side timing tracks network transfer and DOM update times. All timing data is displayed in browser console in human-readable format (e.g., "Filter Total: 1.68s, Database Query: 2ms, Loop Template: 1.66s"). Enable debug mode with ?daf_debug=1 (admin only) to view performance breakdowns.

- MOD – Security: Debug mode now requires admin privileges (manage_options capability) to prevent unauthorized access to debug information. Previously, any visitor could enable debug mode via URL parameter, cookie, or POST data, exposing internal query structure and processing details. Debug mode is now restricted to administrators only.
- MOD – Security: Added origin/referer validation to REST API endpoints (/filter and /get_count) to prevent cross-site request forgery (CSRF) attacks. Endpoints validate that requests originate from the same site domain. Note: These endpoints remain publicly accessible (no authentication required) as they are essential for frontend filtering functionality used by site visitors.
- FIX – Category archive filtering: When filtering by a taxonomy term on a category/taxonomy archive page (e.g., filtering by "shirts" on /category/clothing/), the default archive taxonomy term was being added back to the query, causing incorrect results (showing both the filtered term and the archive term). Now properly detects when a filter is applied for the same taxonomy as the archive and prevents adding back the default taxonomy/term, allowing the filter to replace it correctly.
- FIX – Cache key collision causing wrong post types and layouts – cache key was only using current_page and filter_item_val, causing different post types (e.g., "faqs" vs "blog") or different loop layouts to share the same cache. Now includes post_type, layoutid, and full query hash in cache key generation to ensure complete uniqueness per archive type and layout template
- FIX – MutationObserver error when observing range slider inputs – improved node validation to check if element is connected to document before observing, preventing "parameter 1 is not of type 'Node'" errors
- FIX – Filters not being detected when they don't match specific filter type handlers – added fallback handler to catch filters that don't match checkbox, select, radio, range, date, or text handlers, ensuring all filter types are properly collected and sent to server
- MOD – Enhanced debug logging for customer filters and filter detection – added detailed logging to help diagnose filter detection issues, including warnings when elements with data-name attribute don't have the .divi-acf class
- FIX – Divi 4 Archive Loop: Enhanced filter collection logging and validation – added comprehensive debug logging throughout filter collection process to help diagnose why

filters may not be working. Logs show which filters are detected, their values, and whether they're added to the filter collection. Also added validation to skip filters without data-name attribute and improved logging for customer-related filters

- MOD – Server-side filter processing debug logging – added detailed logging to REST API filter endpoint to track how filters are processed on the server. Logs show whether filters are recognized as taxonomies, which tax_query items are added, and when filters fall through to non-taxonomy processing. Enable debug mode with ?daf_debug=1 (admin only) to view server-side processing details in the response
- *

VERSION 4.0.13 – 16/12/25

- FIX – Reset button: Reset button now correctly restores to the original base query when filters were initially applied via URL parameters (e.g., ?filter=true&category=illum). Previously, reset would use the filtered query from data-filter-var instead of the base query from data-loop-var, causing it to not properly restore to the original query.
- FIX – Archive Loop (Divi 4, Divi 5 & Blocks): Reset button on category/taxonomy archive pages now correctly restores to the archive's category/taxonomy instead of showing all posts. The plugin now automatically detects archive pages and sets onload values to preserve the archive context when filters are reset.
- FIX – Fixed an issue where animated elements inside loop layouts were disappearing upon filter or load more in archive pages.
- FIX – HTML structure inconsistency for products after filtering – products were using incorrect HTML structure after filter (div inside ul instead of li). Fixed across all modules (Divi 4 ArchiveLoop, Divi 5 Renderer, Blocks, REST API) to consistently use ul/li for products and div for other post types. Also fixed loop templates (minimal-list, divi-blog, image-background, custom-template) to use li for products instead of article tags when inside ul containers
- FIX – Category taxonomy filtering not working for custom post types using standard WordPress category taxonomy – when a CPT uses the standard 'category' taxonomy (instead of custom taxonomy like 'cpt_category'), filters were not being applied. Now properly detects and handles 'category' taxonomy for CPTs by checking if it exists in the post type's registered taxonomies
- FIX – Pagination and filtering returning 0 results when tax_query from decoded query conflicts with filter parameters – when filter parameters are present, now clears tax_query from decoded query args to rebuild it fresh from filter parameters, preventing conflicts that caused empty results

- FIX – Pagination parameter type issue – ensures paged parameter is always an integer (not string) for proper WP_Query execution
- FIX – Empty tax_query causing 0 results on pagination – empty tax_query arrays (containing only 'relation' key with no actual query items) now removed before query execution, as WordPress treats empty tax_queries as invalid and returns 0 results
- FIX – Filter counts showing incorrect values when filters are applied – counts were being calculated from unfiltered query instead of current filtered query. Now uses current filtered query so counts accurately reflect active filters (e.g., when "Bass Pickups" is selected, "hardware" shows 0 instead of 4, and "all" shows 8 instead of 206)
- FIX – Loop layout structure changing after filter – improved layout ID detection to try multiple sources (loop_var JSON, original items, container) to ensure the correct Custom Loop Layout is used when filtering, preventing structure changes
- FIX – Hide empty filter options not working after filter click – empty options were not being hidden when "Show empty filter options" setting was disabled. Now properly hides empty options (count = 0) after filters are applied, not just on page load. Also improved count comparison to handle both string "0" and number 0 values
- FIX – Divi 4: "Show Reset after filter" not working – reset button was hidden the whole time
- *

VERSION 4.0.12 – 10/12/25

- MOD – divi-loop-filter.js: Added detailed logging for loop detection, filter processing, and API calls
- MOD – Filter Posts module in visual builder now conditionally shows filter-param-tags container only when Archive Loop is not available
- FIX – Price filter showing products below minimum price – fixed parsing logic where single price value (e.g., "Price min 30") was incorrectly treated as maximum price instead of minimum. Now correctly filters to show only products >= minimum price when only one value is provided
- FIX – Archive Loop (Divi 4 & 5): When applying filters while on page 2+, pagination parameter (post_page) is now removed from URL to reset to page 1 – prevents "no results" when reloading filtered pages that don't have enough results for the previous page number
- FIX – Filters: Single date values are only added when user actually selects a date, preventing default dates from appearing in URLs
- FIX – Filters: Selecting "All" option (empty value or option-all class) now properly removes filter parameters from URL and clears filter tags

- FIX – Filters: Date filters now support all backend-configured date formats (YYYYMMDD, MM/DD/YYYY, DD/MM/YYYY, etc.) with flexible validation
- FIX – Filters: Range sliders at default state (min equals max, or equals full range) are no longer added to URL or displayed as filter tags
- FIX – Filters: Default/unselected filter values (0, "all", empty) are now properly excluded from URL parameters and filter tags display
- FIX – Divi 5 Loop Builder: Filter counts showing only terms from current page when pagination is active – now strips pagination parameters (offset, paged, page) before requesting counts so all available terms are shown across all pages
- FIX – Divi 5 Loop Builder: Filter parameter tags (visible buttons) were not being removed when clicking reset filter – now properly clears all .filter-param-item elements including those in custom containers
- FIX – Divi 5 Loop Builder: Custom filter parameter container setting now properly cleared on reset – reads data-filter-param-container attribute and clears both the .filter-param-tags wrapper and any filter-param-item elements inside
- FIX – Divi 5 Loop Builder: Filtered items were missing dynamic content (images, titles, text empty) – now uses DynamicContentUtils and LoopUtils to properly resolve loop variables including custom meta fields
- FIX – Divi 5 Loop Builder: Custom meta fields (loop_post_meta_key_manual_custom_field) now render correctly after filtering
- FIX – Divi 5 Loop Builder: Dynamic values were not returning after ajax filter
- FIX – Divi 5 Loop Builder: Column classes (et_flex_column_8_24, etc.) were being removed after applying filters, causing items to display in one column instead of two. Column classes are now preserved from original items and applied to filtered results.
- FIX – Divi 5 Loop Builder: Removed et-last-child class from all loop items after filtering to prevent layout issues.
- FIX – Divi 5 Archive Loop: Excluded tags/categories were being auto-selected in filter dropdowns on page load – init_filter_params() was not checking for NOT IN operator in tax_query, causing excluded terms to be treated as selected filters
- FIX – Filter counts showing 0 when SearchWP or similar plugins active – third-party plugins were hijacking WP_Query results via WordPress filters (pre_get_posts, posts_pre_query, etc.). Now removes interfering filters during count queries.
- FIX – Conditional category filters (child categories) not loading
- FIX – Pagination returning wrong post types (showing 'post' instead of custom post type) – caused by WordPress filters (Advanced Post Cache, pre_get_posts hooks, etc.) hijacking WP_Query results. Now using fresh WP_Query with all filters removed.
- FIX – Toggle filter mode: First filter was not clickable on load (missing 'visible' class)

- FIX – Toggle filter mode: First filter could not be closed due to CSS forcing it open
- FIX – Filter values being duplicated on taxonomy archive pages (e.g. tax-1|tax-2 becoming tax-1|tax-2|tax-1|tax-2) – causing posts not to show
- FIX – Direct URL access with filter params (e.g. ?filter=true&degree_type=value) showing "no results" after brief loading – was triggering unnecessary AJAX request when server already filtered results
- FIX – Reset filter showing all post types instead of the configured CPT – now prioritizes data-loop-var (base query) over data-filter-var when determining original query
- FIX – Divi 5: Fatal error "StyleDeclarations::add() Argument #2 must be of type string, array given" when rendering Filter Posts module – added comprehensive validation to ensure all style values are strings before passing to divi/common component
- FIX – PHP Warning: Undefined array key "groupping_taxonomy" in ArchiveLoop REST.php when grouping taxonomy not set
- FIX – grouping_posts() function now checks if groupping_taxonomy is empty or 'none' before processing to prevent unnecessary database queries and filter hooks
- FIX – Filter parameter tags now prioritize Archive Loop module over Filter Posts module when both are present on the page
- FIX – Filter parameter tags duplicate prevention on page reload – tags are now removed before appending to prevent duplicates in Archive Loop
- FIX – Filter parameter container setting (filterParamContainer) now works correctly in Loop Builder context with improved fallback logic to read from multiple attribute sources
- FIX – Filter parameter tags visibility in visual builder – Archive Loop's filter-param-tags container is hidden when Archive Loop module is present, preventing duplicate tag display
- FIX – Divi Machine – Edit Post modal now works correctly on single post templates (Theme Builder) – auto-detects post type
- FIX – Divi Machine – Edit Post modal Divi modules (Post Title, Thumbnail, etc.) now render correctly with proper post context
- FIX – Divi Machine – Map Tooltip CSS was incomplete after filtering – class names were being double-transformed causing missing styles (e.g. icons not showing) – fixed in both REST API and AJAX load paths
- *

VERSION 4.0.11 – 04/12/25

- FIX – Taxonomy filter counts showing zero when posts have assigned terms (WP_Query posts_clauses custom fields not being applied to post objects)
- FIX – PHPCS compliance: use phpcs:disable/enable for multiline prepared SQL statement

- FIX – Fix duplicate title issue with Divi dynamic content on single theme builder templates
- *

VERSION 4.0.10 – 04/12/25

- FIX – Check if Memcache or Redis class exists to avoid fatal error when users choose it and do not have it on the server
- *

VERSION 4.0.9 – 03/12/25

- MOD – Improved security, Sanitize SQL inputs for product filters and queries
- FIX – Divi 4 archive loop product loop template was showing categories now when it was not before Divi 5 code
- FIX – PHP Deprecated: Optional parameter with PHP 8
- FIX – Map Ajax Load Tooltip was not working – Divi Machine
- FIX – Map Tooltip was rendeing shortcode on Filter or Load More Update – Divi Machine
- *

VERSION 4.0.8 – 02/12/25

- FIX – Category Count showing after product filter (Product Loop Template) – Divi 4 module
- FIX – Filter count & paramaters not working on 2nd filter with Divi Machine D4 modules
- FIX – Divi "et_pb_image_container" css causing images in loop to be bigger than container (margin: -20px -20px 29px;)
- FIX – Divi Product Loop Template List view was not side by side
- *

VERSION 4.0.7 – 27/11/25

- MOD – Security improvements
- *

VERSION 4.0.6 – 25/11/25

- FIX – Design on other modules was being removed on filter
- FIX – Grouping by taxonomy was taking a column instead of being on top
- FIX – Improves Divi filter module compatibility by handling mixed attribute formats, converting old D4 column classes to D5 flex classes, refining conversion mappings, and adding safer defaults for smoother D4→D5 migration.

- FIX – Refactored key mappings in conversion-outline.js and conversion-outline.json to align with updated schema, including renaming and path changes.
- FIX – Updated default values in module.json for orderBy and listCookieTime, and expanded the loopTitle selector.
- FIX – Adjusted filter-posts-item default number range.
- FIX – Default order fix to make similar in D4 and D5.
- *

VERSION 4.0.5 – 21/11/25

- MOD – When loading the page with filter in the url, we have added code to filter the posts using php and then the fallback to filter it using Rest on load
- MOD – Remove console logs in Loop Builder Ajax Filter script
- MOD/FIX – 4.0.0 introduced the content as excerpt as limit length was not enough (Loop Templates) – reverted back to just showing excerpt
- FIX – REST API was blocking other endpoints if not admin role
- FIX – Load More Style missing
- *

VERSION 4.0.4 – 20/11/25

- FIX – Loop Layout + Load More + Products render shortcode – all working now
- *

VERSION 4.0.3 – 20/11/25

- FIX – Loop Layout + Load More would render shortcode instead of Divi Layout properly
- *

VERSION 4.0.2 – 20/11/25

- MOD – Blog Loop Template, show excerpt was showing content
- FIX – Added show_title attribute to ArchiveLoop and filter JS for divi-4 filters.
- FIX – Image Background Show content as "none" not working
- FIX – Divi 4 load more & infinite scroll not working
- *

VERSION 4.0.1 – 19/11/25

- FIX – Fixed taxonomy/term processing in REST filter callback to properly build tax_query and avoid duplicate filtering on category pages.

- FIX – When Woo was active, the post type would default to product in our settings when post was chosen before
- FIX – When adding a filter item in the new way Divi Beta provided (in editor section) – it was crashing our settings
- FIX – Filter button hover issue where both reset and submit would expand together
- FIX – Fatal error with transient caching in some scenarios
- *

VERSION 4.0.0 – 17/11/25

- NEW – Full Divi 5 support with Archive Loop, Filter Posts, Filter Posts Item, Post Title, and Thumbnail modules, including live Visual Builder preview
- NEW – Loop Builder AJAX filtering via REST API, integrated with Divi 5 Loop Builder for dynamic, no-reload updates
- NEW – Template Picker in Archive Loop: choose from Divi Library layouts, pre-built Loop Templates, or Shortcodes
- NEW – Minimal List loop template for clean, simple post/product displays
- NEW – React-based settings framework (Vite) with faster UI, searchable settings, and inline documentation accessible from WP Admin
- NEW – WooCommerce: Brand filter (product_brand taxonomy)
- NEW – WooCommerce: Product Type filter (simple, variable, grouped, external)
- NEW – WooCommerce: Featured Products Only toggle2w
- NEW – WooCommerce: On Sale toggle
- NEW – WooCommerce: Price Range filter (min/max price settings)
- NEW – WooCommerce: Recently Purchased products filter with configurable days
- NEW – Sorting: Published Date methods (today/past/future with custom day ranges)
- NEW – Sorting: Custom Field Sorting for non-ACF meta keys
- NEW – Author filter for Archive Loop to display posts by specific authors
- NEW – Sticky Posts Behavior: unified dropdown control with 4 modes (include normally, include without pinning, exclude completely, only sticky)
- NEW – Include/Exclude Terms AND/OR Logic: toggle settings for advanced term filtering with AND or OR logic
- NEW – Loop Builder: Filter parameter tags show active filters with one-click removal
- NEW – Divi 4 to Divi 5 module conversion support with automatic migration of settings
- MOD – Loop Extender compatibility: capture loop data after Loop Extender modifications to ensure correct filtering reset and pagination
- MOD – Loop Template enhancements: Excerpt Click Action (expand/link/nothing), Image Size Selector for featured images

- MOD – Expanded design controls: Archive Loop (results text, pagination borders), Filter Posts Item (filter counts text), Loop Templates (card border/box shadow, image/thumbnail styling)
- MOD – Migrated from admin-ajax to REST endpoints (filter, get_count, loadmore) with endpoint-level caching for faster, more reliable filtering
- MOD – Unified loop/query engine shared across Ajax Filter, Divi Machine, and BodyCommerce for better compatibility, performance, and maintainability
- MOD – Improved template rendering with scoped CSS and class conflict prevention to ensure consistent styles across dynamic loads and repeated layouts
- MOD – Improved dynamic CSS and selector scoping in Loop Builder to prevent style bleed between posts
- MOD – WooCommerce HPOS (High-Performance Order Storage) compatibility by using WooCommerce API in place of custom SQL queries
- MOD – Improved order-by controls and respect for URL-selected order on page reload
- MOD – Grid/List toggle reliability improvements with better state management
- MOD – Filter Swatch: new setting to define alignment of the swatch
- MOD – Add "Category Collapse Close Icon" setting for Collapsible category icon
- MOD – Add ability to click label to expand sub categories in Filter module
- MOD – Divi Machine: Archive Loop – allow to show posts by the user – Current Users Posts
- MOD – Divi Machine: Add "Random" option for Secondary Sortby in Archive Loop module
- MOD – Added setting "Query Filters". When set to Ignore, the module will bypass any query modifications from other plugins or custom code that might affect your chosen settings (e.g. incorrect sorting). Enable this option if your results don't appear as expected.
- MOD – Support for custom tables in ACF filters. When setting an ACF field as a filter item, you can now select a custom table as the data source.
- MOD – Enhanced template configuration with query options to speed up building archive designs
- FIX – Pagination/Load More: fixed duplicate posts when using Load More or Infinite Scroll
- FIX – Pagination/Load More: reset offset when filters are applied to show page 1 of filtered results
- FIX – Pagination/Load More: retain onload tags and categories across pages
- FIX – Masonry: reliably re-initialize after AJAX updates for WooCommerce modules and Divi Machine module
- FIX – Masonry: consistent same-height cards across grid layouts

- FIX – WooCommerce: variable product variations display correctly across paginated pages
- FIX – WooCommerce: product attribute filtering works correctly on product variations
- FIX – WooCommerce: sale badge and flip image display correctly
- FIX – WooCommerce: add parent product tags as classes for product variations (Product Variation as single product)
- FIX – Visual Builder: "Sorry, No Posts" issue resolved (removed double-encoding)
- FIX – Visual Builder: dynamic CSS scoping fixes for proper style application
- FIX – Visual Builder: Auto Detect post type now works correctly
- FIX – Filtering: accurate filter counts including Stock Status and "All" default selection
- FIX – Filtering: range filtering now works correctly for large numbers
- FIX – Filtering: reset filter issue from directly requested filter URL
- FIX – Filtering: FilterPost module can now filter by parent category item when conditional logic is enabled
- FIX – Filter Item: Meta Value order for Custom Meta Name in Filter Posts module
- FIX – Filter Item: Margin/Padding design options for Filter Item Label
- FIX – Filter Item: Stock Status issue on On-load and during filtering
- FIX – Filter Item: Filter Count issue for Stock Status filter item in Checkbox/Radio type
- FIX – Filter Item: Select "All" option when nothing is selected for Filter Item module
- FIX – Filter Item: Show More/Less style issue for Filter Toggle
- FIX – Swatch: Circle shape now displays correctly, all background images showing properly
- FIX – Lightbox: single image lightbox now works correctly after AJAX load
- FIX – UI: Filter loading animation positioning corrected (no longer hidden behind posts)
- FIX – UI: Mobile Toggle icons no longer show on desktop
- FIX – UI: Edit taxonomy term issue resolved
- FIX – PHP: issues in Thumbnail module resolved
- FIX – PHP: error with secondary sort by ACF String field (text) resolved
- FIX – PHP: Date Picker now renders correctly (PHP escaping issue fixed)
- FIX – License: deactivation now works correctly
- FIX – Divi Machine: Issue with filter by address resolved
- FIX – Divi Machine: Loadmore/Infinite scroll issue when Grouping by Taxonomy is enabled
- FIX – Divi Machine: Post Offset with Linked Posts
- FIX – Divi Machine: Thumbnail overflow issue in map marker tooltip layout
- FIX – Divi Machine: Map Marker tooltip layout style issue
- FIX – Divi Machine: Add rel properties to "Next/Prev" pagination buttons
- FIX – JavaScript: Fixed error caused by unescaped HTML in inline output

- FIX – Correct typo mistakes and update module icons
- *

VERSION 4.0.0-beta5 – 22/08/25

- FIX – Add to cart button hover icon is not center vertically.
- FIX – Default filter order by dropdown disappears after use it.
- FIX – Filter Parameter Design settings renamed
- FIX – When you refresh filtered page, selections are not shown.
- FIX – Parameters text color changes border color.Added default border color.
- *

VERSION 4.0.0-beta1,2,3,4 – Divi 5 version of our plugin

- FIX – Parameters text color changes border color.Added default border color.
- FIX – When you refresh filtered page, selections are not shown.
- FIX – Filter Parameter Design settings renamed
- FIX – Default filter order by dropdown disappears after use it.
- FIX – Add to cart button hover icon is not center vertically.
- *

VERSION 3.2.8 – 01/08/25

- FIX – Archive page will not get correct posts/products unless you enable "Is Main Loop" setting.
- *

VERSION 3.2.7 – 29/07/25

- FIX – Resolved the issue of Masonary layout not setting after ajax load more for Archive Loop Module
- FIX – Resolved the issue where duplicate posts were displayed when using 'Load More' or 'Infinite Scroll' pagination
- FIX – Resolved the issue related to the translation text domain
- FIX – Fixed the issue of Gutter gaps not working For ArchiveLoop Module
- FIX – Fixed the styling issue for the PostTitle Module in which the Title Text styling was not applying properly
- FIX – Transient cache issue: the transient caching is not working as expected, sometimes it only considers the first filtered query parameters and then the changed values for the same filter is not working properly.

- FIX – Transient cache issue: added description for missing fields to understand better.
- FIX – Resolved the issue related to align last module at the bottom for ARP Product Loop
- FIX – Gutter Gaps in Machines Archive Loop were not working in some cases, need to add px
- FIX – Resolved the issue for gutter gaps for masonry layout in Archive Loop
- *

VERSION 3.2.6 – 19/06/25

- MOD – Transient Caching Settings – choose type of cache, ip and port.
- MOD – PHPCS checks for security
- MOD – Added box shadow design settings to Loop Template items
- MOD – Added border design customization settings to Loop Template items
- FIX – ACF Filter Sort Problem
- FIX – Issue with searching text not working in some cases
- FIX – Resolved the issue of ACF custom database table mapping
- FIX – Masonry not working with loop templates
- FIX – Default hide button of validate button and rename db cache type
- FIX – Search not filtering by secondry sort
- FIX – In ArchiveLoop Module, Group by Category will show the Main Parent category assigned to the post and if there are multiple parent categories, it will show the category created first.
- *

VERSION 3.2.5 23/05/25

- FIX – Loop Templates, Show Excerpt and Show Feature Image setting option not working
- FIX – Disable ajax pagination not working in BodyCommerce
- FIX – can't register a new CPT with divi machine or ACF plugin
- FIX – SortBy ACF field not working
- *

VERSION 3.2.4 – 13/05/25

- FIX – Resolved the issue of past posts display after ACF date filter for future posts
- *

VERSION 3.2.3- 12/05/25

- FIX – Label not being hidden when want to

VERSION 3.2.1 – 08/05/25

- FIX – Issue where Divi Theme Options would not load with certain servers using Redis Cache
- *

VERSION 3.2 – 06/05/25

- NEW ADDITION – Transient Caching for Ajax Filter. Transient caching helps speed up your website by temporarily storing data, reducing the need for repeated database queries. This makes filtering and searching faster while keeping your site efficient.
- NEW ADDITION – You can now filter ACF Custom Tables – https://wordpress.org/plugins/acf-to-custom-database-tables/
- MOD – Filter Post: Filter Initially Loaded Posts Only, this will only include the posts that are loaded on the first load and not include any more posts in the filter
- MOD – Changed our method for masonry calculation, we use macy js now which is small lightweight file but more accurate
- MOD – Modified our filters that if you are on the single post/product page we send the ID too
- MOD – Date Picker – Added language selection
- MOD – Variation as Single Product – when using our post title module, it will display the product name and then the variation so its clear. For example it will be "Hoodie – Blue" or "Hoodie – Green"
- MOD – Adjusted our filters "db_archive_module_args" and "divi_archive_post_args" to have ID too – this will be the post ID or the archive post ID for you to use. EG: apply_filters('db_archive_module_args', $args, $post_id_args = null);
- MOD – Archive Loop module (Ajax Filter + BodyCommerce), new setting to display Related Products, Category Matching, include and exclude attributes
- MOD – Filter Price, Min & Max Price Setting – you can choose to show them based on the related products when using on a single product page
- MOD – WooCommerce active and product loop is on the product page, you can show the price being min and max of related products
- MOD – divi_filter_range_min, divi_filter_range_max, divi_filter_range_from, divi_filter_range_to filters added to ACF Filter Item. You can hook in and modify the min and max values.
- MOD – New setting "Auto-Close Toggle on Filter" – when you have toggle, you can make the others close or stay open depending on the selection

- MOD – New setting "Auto-Close Toggle on Filter" – when you have toggle, you can make the others close or stay open depending on the selection
- FIX – Resolved an issue in the Archive Loop module where the filter ignored values from the "Exclude Terms" option in the Terms tab under Loop Options.
- MOD – Search Field – Date Range – Added underscore(_) as supported characters for ACF Field Name
- FIX – Eliminated various PHP warnings
- FIX – Changed anchor position into postTitle to support focus
- FIX – Added tabindex to the loadmore button to support focus
- FIX – Fixed issue with filtering in ACF relationship/posts object field using filter posts in the Posts Filter Module.
- FIX – Alignment of the radio buttons when inline was lower than the div, it is lined up right now
- FIX – Added support for the all type of category structure in the Divi Machine Archive Loop and Divi Machine Categiry Loop for "Include Categories" and "Exclude Categories" field
- FIX – In Archive Loop, added Sort by Relevance in the sorting after filter success
- FIX – Added a filter to trigger on the removal of focus from the input search field in the Filter Post module.
- FIX – Resolved the issue with the "Include" option being auto-selected in the Filter Posts Module.
- FIX – Resolved the styling issue for the pagination item hover for both archive and category loops, set it same as the active item.
- FIX – Resolved the styling issue for the global colors not applying properly for both archive and machine loops.
- FIX – Resolved an issue in the Archive Loop module where the filter ignored values from the "Exclude Terms" option in the Terms tab under Loop Options.
- FIX – Eliminated various PHP warnings
- FIX – Changed anchor position into postTitle to support focus
- FIX – Added tabindex to the loadmore button to support focus
- FIX – Fixed issue with filtering in ACF relationship/posts object field using filter posts in the Posts Filter Module.
- FIX – Alignment of the radio buttons when inline was lower than the div, it is lined up right now
- FIX – If using Machine and products, with pagination it would revert to WooCommcerce and the icons/styling would be a little different. Now we will check if its machine pagination and keep using that

- FIX – On Sale Product Only, if checked and no products on sale, it would show ALL products. Now will show no results
- FIX – Post Object when filtered by 2 taxonomies (in settings) – was not showing. Filter Item + Show Empty Options
- FIX – Variation as Single Product – ACF flip image was not working
- FIX – Machine Archive Loop: Fatal error when filtering products
- FIX – WPML translation of loop templates in ajax call
- FIX – Custom Meta Sorting in Filter
- FIX – Reset checkbox when it is a select from paramater not working
- FIX – Stock Status woudl not check "all" by default if radio
- FIX – Hide or show filters based on screen size when the "Toggle Whole Filter" option is enabled on mobile.
- FIX – Filter Posts – Resolved Map Radius Search Dropdown CSS Issue.
- FIX – Stock Status would not check "all" by default if radio
- Fix – Fixed JavaScript error caused by unescaped HTML in inline output.
- *

VERSION 3.1.8.6 – 11/10/24

- MOD – Update to license validation
- *

VERSION 3.1.8.5 – 10/10/24

- FIX – Minor cases, fatal error when our server blocks the license check. Added code to avoid fatal error if the block happens and an empty response is returned
- *

VERSION 3.1.8.4 – 10/10/24

- MOD – Fatal error when BodyCommerce and Machine installed together with shared declared function
- *

VERSION 3.1.8.3 – 08/10/24

- MOD – Modified the check for license key to our website to only check every 24 hours if no key is added
- *

- MOD – Divi Machine: If sort order is date picker (today and future, today and past etc) and secondary sort order is a date picker as well – we will
- 1) Get the posts available first, for example all posts today and in the future.
- then
- 2) We will sort those posts by secondary sort order
- use case: Show posts in the future based on "end date" and then sort those posts by "start date"
- FIX – Animate modules (like blurb) after ajax load
- FIX – Inline Checkbox/Radio filter item issue when Show Empty is enabled
- FIX – Ajax Load More, Product Price sorting out not stay the same, it would sort by default
- FIX – Divi BodyCommerce – Variation Swatches: Strikethrough not working well after ajax loaded products
- *

VERSION 3.1.8.2 – 16/09/24

- MOD – Add "Allow duplication filter count for parent option?" in Radio/Checkbox section of SearchPostsItem module.
- FIX – PHP error in Archive Loop module when Divi Ajax Filter is not used for Woocommerce
- FIX – Prevent clicking toggled off filter item
- FIX – Divi Machine : PHP error for Random orderby with Secondary orderby option
- *

VERSION 3.1.8.1 – 10/09/24

- FIX – Divi Machine : PHP fatal error with implode() Machine Archive Loop
- FIX – Reset button showing when "Show Reset button only after filter change?" is off and hide reset is on
- *

VERSION 3.1.8 – 02/09/24

- MOD – Divi Machine : Archive Loop – allow to show posts by the user – Current Users Posts
- *

VERSION 3.1.7.3.1 – 18/04/24

- FIX – Default Orderby option for Product Loop module is not working
- FIX – Sanitizing comment

- *

VERSION 3.1.7.3 – 16/04/24

- FIX – Sale Badge not showing for Flip Image
- FIX – Custom Sale Badge upload not showing on single page
- FIX – Layout broken when switched from No Result layout
- *

VERSION 3.1.7.2 – 10/04/2024

- FIX – ACF Field value for Archive Loop module with Linked Posts Type
- FIX – Filtering issue from security update
- FIX – PHP error in Filtering with multiple checkbox values
- FIX – Issue showing Relationship ACF Field in Machine Loop
- *

VERSION 3.1.7.1 – 03/04/24

- FIX – Arrow position of map search inline position
- FIX – PHP deprecated warnings $default values for modules
- FIX – Non Main Archive Loop on category page
- FIX – Space issue in taxonomy terms of Product Loop module
- FIX – Address Filter issue
- FIX – Product Variation filter issue
- *

VERSION 3.1.6.5 – 19/03/24

- FIX – Escaping for Marketplace
- *

VERSION 3.1.6.4 – 06/03/24

- FIX – BodyCommerce Variations default selection as well as hiding the select options with variation swatches in archive loop
- FIX – Machine all posts on map not showing
- FIX – Variations as a single product issue with loop template
- FIX – Filter Item module php warning
- FIX – Pagination issue when Loop items sorted by price

- *

VERSION 3.1.6.3 – 20/02/24

- FIX – Equalize column height is no longer breaking list-grid column structure in grid mode
- FIX – Default Loop Template not working without Woo, there will be "none" as default if no Woo, otherwise it will be shop template
- FIX – Issue with remove filter parameter
- *

VERSION 3.1.6.2 – 13/02/24

- MOD – Search Item: Deselect Included Options by Default?" When the loop module includes specific options (e.g., categories), they are auto-selected by default. Enable this option to default the selection to "All", preventing auto-selection of included options.
- FIX – Remove Filter Params when All option is selected
- FIX – php warning for ajax date picker
- FIX – Search Text Filter does not work the 2nd time after ajax return
- *

VERSION 3.1.6.1 – 06/02/24

- FIX – Filter Count issue for product tag
- FIX – Escaping for Marketplace
- *

VERSION 3.1.6 – 31/01/24

- NEW ADDITION – Add Date/Date Range picker filter type and disable past/future dates.
- FIX – Machine Archive Loop custom template ajax filter only getting custom-template and not one differently named
- FIX – ACF shortcode not rendering in ajax load – this issue is actually ACF and not us, but added compatibility
- FIX – Loop Template, Blog style. If no categories, it will just show the seperator, this will be hidden now.
- FIX – All Text for category/radio was not working on sub-categories.
- FIX – Button – Loop Template, added setting to customise the button styles in the loop template
- FIX – Indent checkbox clickable space was small

- FIX – Post offset issue with WPML and Pagination
- FIX – Checkbox/radio intent normal style – input was overlapping text
- FIX – Post Modal ajax 403 error
- *
- VERSION 3.1.5.3 – 20/12/23
- MOD – Add option for centering map to the first post or not
- FIX – Subcategory indent styling issue for SearchPostItem module
- FIX – Pagination auto-scroll to "fine tune" – negative number was not working
- FIX – Compatibility issue with relevanssi for getting filter count
- FIX – Collapsible Category disable parent would cause space on the left for Divi Style
- *
- VERSION 3.1.5.2
- FIX – Pagination not working
- *
- VERSION 3.1.5 – 05/12/23
- MOD – Add option for sorting by custom meta field
- MOD – ACF Post Object categorizing by its taxonomy terms
- FIX – SVG code not rendering full HTML in the loop
- FIX – Loop Template – Image Background – Meta seperator not working
- FIX – Filtering issue due to sync filter items
- FIX – Filtering issue for Exclude Products
- FIX – Infinite load would activate the filter loading icon as well (causing 2)
- FIX – CSS class to hide module on grid view was not working after ajax load
- FIX – Checkbox position when indented radio/checkbox filter
- FIX – Map Marker infowindow center issue after Ajax content loaded
- FIX – Sound file not working on archive loop
- FIX – Filtering issue for multiple same filter options
- FIX – Url Query parameter affects non-main loop module
- FIX – Align last module for loop templates were not working
- FIX – Product Pagination not working with After Shop module
- FIX – Filter Parameter issue for select type filtering option
- *
- VERSION 3.1.4 – 01/11/23
- MOD – Pagination design settings
- FIX – Filtering issue due to sync filter items
- FIX – Filtering & Filter Count issue for multiple same filter modules
- FIX – Remove Param issue for multiple same filter modules

- FIX – Relevanssi compatibility with Search Posts module
- FIX – Show correct posts on date archive page
- FIX – Empty options not hiding on archive page some cases because of Divi CSS overwriting it.
- FIX – Active swatch appearance for ACF swatches
- FIX – Collapsible Taxonomy
- FIX – Ajax Filter PHP error
- FIX – Variation Add to cart not working on Divi Machine's Post Modal
- FIX – Show All pins when show empty on load is enabled
- FIX – Hide Paginations when show empty on load is enabled
- FIX – Uncheck All option is not working
- FIX – Sort by ACF Date Time Picker issue
- FIX – Align last module with list/grid layout
- FIX – Archive Loop Featured Posts only issue
- FIX – Exclude Category issue for core post type
- *
- VERSION 3.1.2 – 29/09/23
- FIX – Thumbnail default size option
- *
- VERSION 3.1.1 – 26/09/23
- NEW ADDITOIN – Add pagination to top, bottom or both in Divi Machine
- MOD – All options under parent terms
- FIX – Disable redis and object cache getting ID's only for filter count
- FIX – Scroll to Filter module issue on load
- FIX – Show Empty Options issue for filter item
- FIX – Filter Count issue for category terms
- FIX – Archive Loop module for post object field inside Repeater
- FIX – Loop Templates: Background. Always show content CSS issue
- FIX – Fix PHP errors
- FIX – Divi Machine – no results layout on load, when filtering would not make a grid after that
- FIX – Show Empty On Load issue for Machine Loop module
- FIX – Search filter, hide paramaters was not working
- FIX – Disable products when category has child categories issue
- FIX – SVG File Support in Loop Layout
- FIX – Default value for thumbnail not working on machine
- FIX – When text search and scroll to section on change – it would do this on page load

- FIX – Filter Count issue with update filter count on clicked items off
- FIX – Search keyword on refresh
