CHANGELOG

3.2.0 - 21 Oct 2026

Added:

- **pCloud Install**: install plugins from a pCloud public folder link. Paste the link, pick the .zip files, install. No API key needed.

Improved:

- Backups and sync working files are now stored in a randomly named folder, outside the web root where the server allows it. Their file names get a random suffix, so they can't be guessed. Existing backups are moved there automatically.
- The Backup page warns when the backups folder can be opened from the web.
- Sync: a plugin that crashes on every request can no longer stop a running sync from continuing, cancelling or rolling back.
- The backup list shows only the backup's name, not its full path.
- Google Drive Install: an empty folder now says "No .zip files in this folder.", and a Drive error shows Drive's own message.

Bug Fixes:

- Plugins → Install and Themes → Install install every dropped or selected .zip again, not only the first one.
- Restore now refuses a backup path outside the backups folder.

3.1.0 - 09 Oct 2026

Added:

- **WP Config**: turn WordPress constants such as `CORE_UPGRADE_SKIP_NEW_BUNDLED`, `DISABLE_WP_CRON` or `DISALLOW_FILE_EDIT` on and off, written into wp-config.php; constants set elsewhere are shown locked.
- **File Manager revisions**: save titled restore points of a file, compare any of them with the editor, restore, duplicate or delete them.
- **Users Manager**: edit username, email and role inline.
- **Base64 tool**: data URIs, CSS backgrounds, `@font-face`, batch mode for a whole stylesheet, SVG optimisation and image resize before encoding. New Tools: URL Encode/Decode, HTML Entities, Hex/Binary/Text.
- **Sync**: a read-only key, so a site can be pulled from but refuses pushes.

Improved:

- Sync and restore keep you logged in, also on sites whose salts are not in wp-config.php (every WordPress Studio site).
- A pull that fails after this site's database was (even partly) replaced now restores the replaced tables from the safety backup automatically and removes the tables it added.
- Backups contain only this site's tables, and a restore never touches other WordPress installs that share the same database.
- Sync copies uploads first, then plugins and themes, then the database, and swaps each plugin and theme folder in whole, so a site never runs a half-copied plugin during a sync.
- Sync and restore keep the site's own sync key and connection.
- A warning before pushing into a site that runs an older DevKit.
- Restoring by upload works for backups larger than the server's upload limit.
- Plugins Disabler on multisite: turning it off on one site no longer stops it on the whole network.

Bug Fixes:

- Sync failed with "The stored connection secret could not be read." on sites with default (placeholder) salts, leaving the site half-pulled.
- On WordPress Studio and other SQLite sites, a backup of a site running Wordfence could run forever and fill the disk.

- Files containing the word `SLASH` (e.g. `JSON_UNESCAPED_SLASHES`) were corrupted when saved in the File Manager.
- The File Manager's old `.bak` copies (wp-config.php included) were stored where a web server could serve them; DevKit now removes them.
- Plugins Disabler could permanently deactivate a disabled plugin when another plugin saved the active plugins list.
- Deleting an image now also removes the WebP copies DevKit made.
- The File Manager list no longer jumps when a row is clicked.
- URL migration no longer doubles the port (localhost to localhost:8881).
- Restoring with a different table prefix could keep the wrong user roles.
- A database error or a full disk during a backup now fails the backup, instead of producing an incomplete backup that reported success.
- On MySQL, a restore that failed while swapping tables could leave a core table missing; the original tables are now put back.

3.0.0

Rebuilt admin interface, a new Sync module, and a faster, quieter plugin.

- **Added**
  - Sync — copy a database, uploads, plugins and themes between two DevKit sites. One site issues a key, the other pastes it, then pulls or pushes. URLs are migrated and a safety backup is taken first.
  - Reset keep lists — pick the options, plugins, themes and users a reset must not touch, from the Reset screen itself.
  - Terminal — an admin shell with a bundled WP-CLI.
  - New admin interface across every module.
- **Changed**
  - Update checks: cached for 12 hours, 3-second timeout, and a failed check now backs off instead of retrying on every page load.

    - Country Block: a failed geo lookup is remembered, and a rate-limited provider is skipped rather than waited on.
    - Maintenance and cleanup tasks moved to a daily cron instead of running on admin page loads.

- **Fixed**
    - A restore or sync could fail on servers that store table names with different capitals.
    - A kept permalink_structure was overwritten during a reset.
    - The bundled WP-CLI wrapper could pick a server PHP binary that WP-CLI refuses to run.
    - An unreachable update server could stall wp-admin on every request.
    - Deleting a parent theme no longer removes an active child theme.
    - Kept users are restored with their own password and role.

2.2.3 - 16 Februray 2026

- **Bug fixes**
    - Hotfix for backup download files issue

2.2.2 - 16 Februray 2026

- **Bug fixes**
    - Hotfix for database backup was exhausting memory limit

2.2.1 - 13 Februray 2026

- **Enhancements**
    - Temporary login hook added
    - Backup/restore URL migration
    - Improved error log
    - File manager file types added

- **Bug fixes**
    - File manager context menu scroll fix

2.2.0 - 19 January 2026

- **New Features**
  - Duplicate post/page/custom post types
  - Temporary login
  - Revision limiter per post type
- **Bug fixes**
  - wp-config.php settings fix for checking if constants are already defined
  - Sidebar styling fix

2.1.0 - 16 December 2025

- **New Features**
  - Country block
  - Folder search in File manager
- **Enhancements**
  - Adminer latest version
  - Maintenance mode can be allowed for specific IPs

2.0.0 - 09 December 2025

- **New Features**
  - Delete transients option in WP Reset Panel
  - Backup and Restore feature
  - Country Block panel
- **Bug Fixes**
  - Continuous updates were putting pressure on server
  - Per day update limit removed

1.8.1 - 22 August 2025

- **Enhancements**
  - Under settings page added option to toggle between DevKit Error Screen and WP Default
  - Fixed Deprecated Constants

1.8.0 - 26 Jul 2025

- **Features**
  - Images - Hide media files from non admins
  - Notes. Private and shared across all admins

1.7.1 - 7 May 2025

- **Features**
  - Images URL Redirect
- **Enhancements**
  - Search and replace rebuild
  - User switch have button to go back to the original user

1.7.0 - 20 March 2025

- **Features**
  - Install plugins from Google Drive
  - Install plugins from WordPress.org
  - Error handling in Files Manager
- **Enhancements**
  - Adminer security update
- **Bug Fixes**
  - Reset fix for themes. In reset due to security issues themes got removed

1.6.1 - 26 February 2025

- Bug Fix:
  - Adminer table vertically scroll
- Security Update:

    - Adminer’s loading mechanism has been updated with enhanced security measures, ensuring that non-administrative users cannot access the Adminer file, even if they possess its direct URL.

1.6.0 - 21 February 2025

- **Features**
    - Completely New UI ✨
    - Image Optimization got SVG upload. You can set per user role who can upload SVG
    - SVG Inline option. It will convert IMG tag to Inline SVG
