Updates and Maintenance

Updating OpenClaw gets fixes for stalled upgrades, plugins left behind, and confusing recovery messages. There are also improvements to bringing older conversations and settings forward, backing up the files you need, and cleaning up history without getting in the way of other work.

Phone interruptions and brief audio errors

Memory

Memory fixes help your Claw find remembered details and return to older conversations. There is also clearer guidance when memories cannot be saved, or when deleting a conversation leaves its memories behind.

Get model results without waiting on diagnostics

Find the provider instructions you need

Automations and Scheduling

Automations are easier to manage, with direct links to edit them and names you can recognize. Scheduled tasks also get fixes for getting stuck, returning results to your chat, and staying quiet when there is nothing to report.

Handle large tool replies and disconnects

Use accurate time limits for connected devices

Get answers from a separate agent in Google Meet

Security and Privacy

Your Claw can make more decisions about routine commands without interrupting you, while still asking for approval when needed. There are also fixes for keeping file access within the permissions you chose, protecting shared conversation history when

deleting an agent, and keeping private update records out of backups and support bundles.

You can now answer your Claw's questions and enter secrets from the terminal, with clearer output to read and copy afterward. There are also fixes for starting and restoring coding workspaces, giving delegated tasks enough time, and finding the help you need when something goes wrong.
