

Like Google Drive, but on your own server.

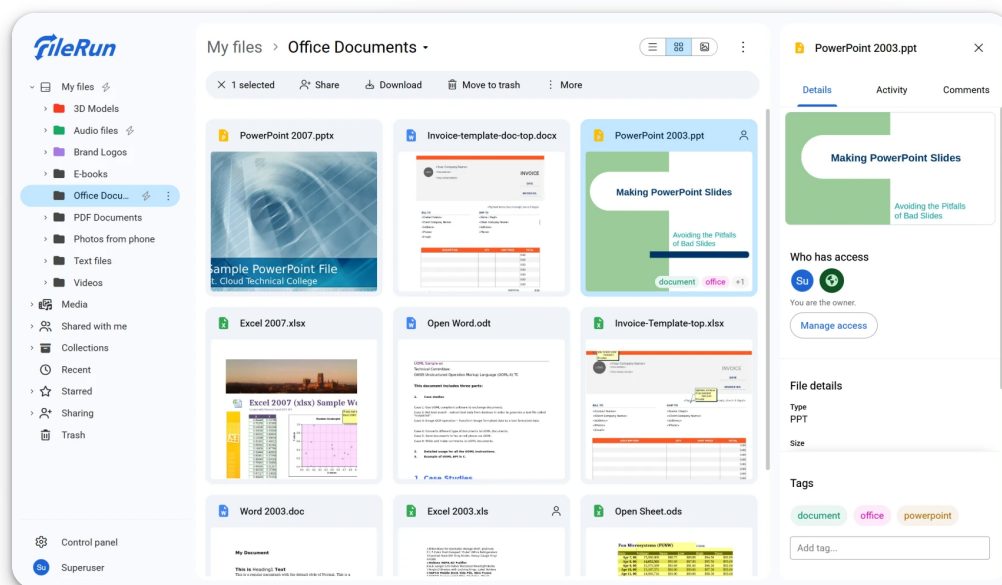

FileRun is a self-hosted file sharing application for your team. You install it on your server, so the files stay with you and no one else can reach them.

It uses the folders you already have. No import, no migration.

€9.9 per user per year. The storage is your own disk, so it is never billed.

TRUSTED SINCE 2003 BY

Why your own server

The three things you cannot get from Dropbox, Box or Google Workspace at any price.

No third party in the middle

Your files and their metadata stay on your own server.

No outside company holds your data, and there is no monthly bill that grows with your storage.

No import, no migration

FileRun manages the files already on your server's filesystem, exactly where they sit.

Point it at a directory and you are done.

No vendor lock-in

FileRun never stores your files inside its database. They stay normal files in normal folders.

You can still read them with rsync, Samba or any backup tool, even without FileRun.

Everything your team does with files

Share them, work on them together, reach them from anywhere, and find the one you need.

Without sending anything to somebody else's cloud.

File sharing

Stop e-mailing attachments and stop uploading company files to somebody else's cloud.

Share a folder or a file with one person, with a whole group, or with somebody outside your organization — you choose what each of them is allowed to do.

INSIDE YOUR ORGANIZATION

- ✓ Share with single users, or with a group.

- ✓ Pick one of **seven roles** with a single click, from view-only up to full control of the contents.
- ✓ The folder appears under **Shared with me** in the other person's account. Nothing is copied, and nothing is moved.
- ✓ Lock a file while you work on it, so nobody overwrites your changes.
- ✓ Follow a folder, and get an e-mail when somebody changes something in it.

WITH PEOPLE OUTSIDE

- ✓ Share with an e-mail address, even if that person has no account. FileRun creates a guest account for them, and removes it when their last share is gone.
- ✓ Or send a link. The person who opens it sees the full interface, not a limited public page.
- ✓ Protect a link with a password, an expiry date, or a limit on the number of downloads.
- ✓ **File requests:** give the link the Uploader role and it only accepts uploads. The person who receives it can add files, but cannot see or download the files that are already there.
- ✓ Turn off every public link on the server at once.

Access your files from anywhere

Your files sit in a normal folder on your computer. Work in the programs you always use, save as usual, and **the changes go to the server on their own.**

The same files are accessible from your mobile device, and from any program that speaks WebDAV.

ON THE COMPUTER

- ✓ Two-way sync for Windows, macOS and Linux.

- ✓ Sync the whole account, or only the folders you choose.
- ✓ Anything a colleague changes arrives the same way, without anybody sending a file.
- ✓ Each computer gets its own password, separate from the account password. Lose a laptop, and you revoke only that one.

ON A PHONE, OR AS A NETWORK DRIVE

- ✓ iOS and Android apps.
- ✓ Photos taken on the phone can be copied to your own server automatically.
- ✓ Standard WebDAV, so Windows Explorer, Mac Finder and any WebDAV client can open your files with no app from us at all. Tested with rclone, Cyberduck, Mountain Duck, WinSCP and GoodSync.
- ✓ Web, WebDAV, desktop, mobile and the API can each be turned off separately, and all of them use the same permission checks.

Document editing

Read and edit documents without leaving FileRun, with the office suite your organization already uses.

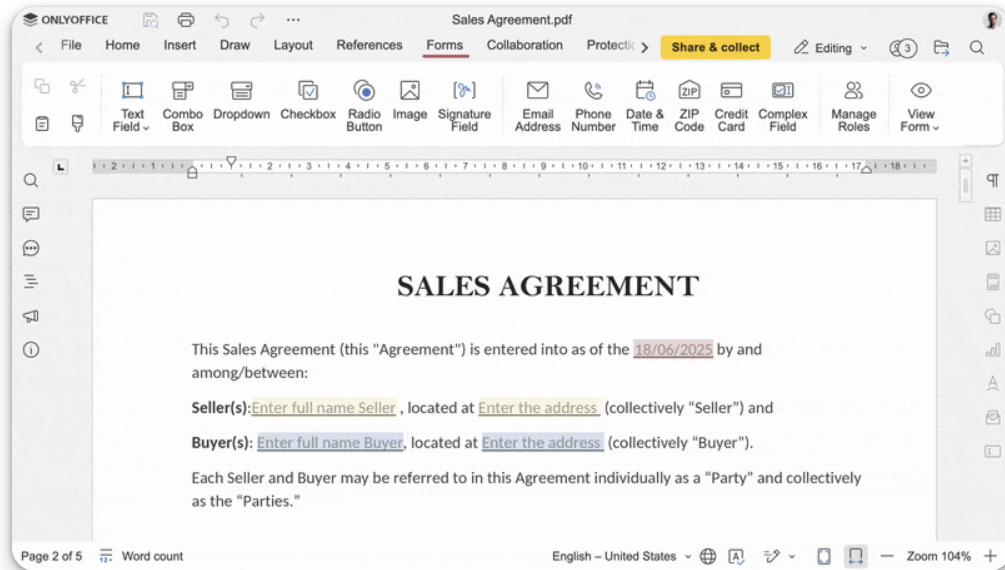

Several people can work on the same document at the same time, and everybody sees the changes as they happen.

ON YOUR OWN SERVER

- ✓ ONLYOFFICE
- ✓ Collabora Online
- ✓ LibreOffice Online
- ✓ Euro-Office

OR AN ONLINE SERVICE

- ✓ Google Docs
- ✓ Zoho Docs
- ✓ Microsoft 365

Uploads without limits

Other web applications cut each file into chunks before sending it. That is why they ask you to raise limits in the server configuration, and why they slow down or fail on a folder with thousands of files.

FileRun streams the file instead. There is nothing to configure, and no size to stay under.

- ✓ Upload huge files, with no limits.

- ✓ Automatically resumes interrupted transfers, exactly from where you left off.
- ✓ Drag & drop files and folders from Windows Explorer or Mac Finder to your browser.
- ✓ Copy/paste files, folders or other media content from Windows Explorer, Mac Finder or other apps, directly into the browser.
- ✓ Upload large folders with tens of thousands of files and subfolders.
- ✓ Folder sync, straight in the browser:

When you upload a large folder, FileRun automatically compares file sizes and modification times, and transfers only the files which are missing from the server, or which have been modified.

Security is the reason you are here

Moving your files to your own server only helps if the software on it is secure.

Here is how we protect your files.

Audited by outside specialists

FileRun is put through third-party security audits on a regular basis, and tested extensively before every release.

Findings are fixed and shipped, not filed away.

A complete audit trail

Every action is recorded with the IP address and the program that made it, and the record keeps the user's name even after that account is renamed or deleted.

Actions that fail are recorded too, and the record says why.

Safe on the first day

New accounts start with link sharing, guest sharing and file history turned off.

Passwords use Argon2id, two-factor can be made compulsory, and changing a password signs out every other session.

How security works

Fits how you already work

FileRun uses the systems your organization already has, carries your name instead of ours, and gives your own software a complete API.

Sign-in

Your users keep the accounts they already have. LDAP, Active Directory, SAML, Microsoft Azure, OAuth2, Authentik and more.

Your brand

Your logo, your colors and your own wording throughout the interface. Start from a ready-made theme, or create your own.

Apps under your name

Give your users desktop and mobile apps that carry your branding, not ours.

See how it fits

Running it is not a project

Self-hosting has a reputation for being hard work.
FileRun needs very little to run.

Runs anywhere

Linux or Windows servers.
Shared, dedicated or VPS hosting.
Unraid, TrueNAS or any other NAS.
Docker, a VM, or bare metal.
It only needs PHP and MySQL.

One server is enough

Thousands of users and millions of files on a single machine — no high-availability cluster, no load balancers, no per-node licensing. Fast enough on old hardware.

Updates that don't break things

Update, and keep working. In continuous development since 2003.
You do not need to plan downtime, or prepare a way back to the old version.

A quarter of the price.
Often less.

The products FileRun is usually compared against charge four to eight times more for each user, and then charge again for support that answers within a promised time.

Storage is your own disk, so it never reaches the bill at all.

SELF-HOSTED FILE SHARING	PER USER, PER YEAR	100 USERS, PER YEAR	SUPPORT WITH AN SLA
FileRun	€9.9	€990	Included
Seafile	\$48	\$4,800	<u>+ \$5,000 a year</u>

SELF-HOSTED FILE SHARING	PER USER, PER YEAR	100 USERS, PER YEAR	SUPPORT WITH AN SLA
Pydio	€60	€5,980	<u>Costs extra</u>
Nextcloud	€71	€7,129	Included
FileCloud	\$84	\$8,400	<u>Costs extra</u>

Prices taken from each company's own pricing page and checked in August 2026.
