FileRun Update 2026.2.1 (July 2026)

July 23, 2026

- Fixed security vulnerability: CWE-78 (OS Command Injection).
CVSS 3.1: 8.8 High.

July 5, 2026

- Added control panel tool for batch-assigning roles.
- Fixed protocol incompatibility with Nextcloud OCS V1 API endpoint request `/ocs/v1.php/cloud/user` returning the success code as 200 instead of 100. This fixes provisioning the desktop app with new accounts via the command line.
- Added file handler "Open locally" which can be used to open files or folders on your local computer from the browser. Requires the Nextcloud desktop app to be installed and the file/folder to be accessible via one of the configured sync folders.
- Added plugin for creating/editing office files with Euro-Office (<https://github.com/Euro-Office/> - an open-source ONLYOFFICE fork).

- The office editors ONLYOFFICE, Collabora, Euro-Office, Microsoft 365 and LibreOffice Online are now loading with the user interface in the same language as FileRun (where supported).
- Fixed downloading folders via shared links by directly accessing the URL with `&fmode=download` (or the old way `&download=1`).
- Fixed PHP error trying to email the login information when creating a new user account as admin from the control panel. (Undefined array key "activation_url" in `/var/www/html/apps/Core/!includes/emails/english/signup.tpl.php#21`)

May 21, 2026

- Fixed redirection after authentication via SSO. This will fix logging in with desktop or mobile apps when authenticating via SSO.
- Fixed compatibility with iOS Nextcloud when the server does not have a logo configured.
- Fixed iOS Nextcloud accent color (folder icon colors, buttons, etc).
- Fixed autoplay of audio files when the option `Disable the automatic playback of the next file` is enabled.
- The file uploading uses now a 30 seconds timeout to prevent transfers from hanging indefinitely when the server returns errors.
- Added control panel option for creating a full database export file.
- Fix: The `Extract archive` option is no longer shown for unsupported files types.

May 9, 2026

- Sharing files/folders now works fine from all the Nextcloud apps (iOS, Android, Windows). The permissions are shown correctly based on the selected sharing role, and change applied via permissions are applying the correct role without errors.
- Added support for WebDAV COPY for both files and folders. Copying files/folders now also works via the mobile apps.
- Added support for WebDAV COPY/MOVE overwrite (will delete the destination if it exists).
- Fixed extracting from archives files/folders with names starting with a dot or space character.
- Fixed copying folders that contain files/folders with names starting with a dot or a space character.
- The setting `Hide dotfiles (~/.*)` (under the `Interface` control panel section) no longer affects other areas of the software. The following behaviors have been corrected and they are no longer dependent on that setting:
 - Downloading folders always include files and folders with names starting with a dot.
 - Zipping folders always includes files and subfolders with names starting with a dot.
 - Searching always includes files and subfolders with names starting with a dot.
 - Browsing folders via WebDAV, API or desktop syncing always shows files and folders with names starting with a dot.
 - Indexing applied to files and folders with names starting with a dot.
 - Metadata is being imported from files and folders with names starting with a dot.
 - Thumbnails are being generated for files and folders with names starting with a dot.

- Fixed logging a login entry for each WebDAV request.
- Fixed extracting files/folders from archives, when their names start or end with space character.
- Fixed autoscroll of the breadcrumbs bar on mobile.
- Fixed adding a role with the **User can read comments** option disabled.
- Fixed **getcontentlength** property missing in PROPFIND **allprop** requests. Improved WebDAV protocol compatibility.
- Fixed error when trying to generate app credentials on accounts which do not have a stored password (because they authenticate via a third-party system).
- Fixed incorrect display of permission field **User can access the files' activity logs** when editing a user account when **File-centric user activity logs** is off.
- Added control panel option for setting the size of a "small" file. This value will be taken into account for optimizing file uploads.
- Fixed error when trying to install FileRun 2026.2.0 fresh while updating an existing database from an older FileRun version.
