FALKORDB CLOUD

🌟 JUNE 2025 NEW UPDATE: Improved UI & Experience

Visualize, manipulate and manage FalkorDB graph data interactively to monitor and explore data changes. The latest version introduced the following improvements

Faster Graph Creation & Querying

Quickly create new graphs and run queries with fewer clicks. The UI now guides you through graph setup with smarter defaults and clearer feedback.

Simplified Node Editing

Editing node properties is now faster and more intuitive. Fewer modal windows, inline property editing, and immediate updates make this flow significantly more usable.

Query History Panel

A new history panel stores your recent queries. This makes it easier to iterate, profile, debug, or rerun past queries without leaving the editor.

Better Search

The search bar now indexes schema, nodes, and metadata. Results are ranked more effectively and load with lower latency.

Expanded Settings & User Controls

New options let you fine-tune database behavior, toggle visual preferences, and manage users without falling back to CLI tools.

Node Style Customization

Customize the visual appearance of nodes per label. Select custom colors from a palette, adjust node sizes, and choose which property to display as the node caption. All customizations are saved per graph and persist across sessions.

```
# Access via port-forward  
kubectl port-forward svc/falkordb-browser 3000:3000
```

For detailed configuration options and examples, see the [Helm chart documentation](#).

Build and run browser from source

Prerequisites:

- Node.js 20.9.0 or higher

Steps:

- Clone the git repository `git clone git@github.com:FalkorDB/falkordb-browser.git`
- Create .env.local in the clone directory `cp .env.local.template .env.local`
- Build the node project `npm -i`
- run the server `npm run dev`
