Sometimes when Dags are written bad with top level code it can happen that arguments are made visible in error messages.
This PR masks invalid kwargs as a safeguard.

Mask kwargs on illegal args ✓ 02e1131

jscheffl added the backport-to-v3-1-test label on Nov 13, 2025

jscheffl requested review from amoghrajesh, ashb and kaxil as code owners 5 months ago

Should we redact when this message is written to the db (?) instead? That would also cover some more cases. It feels a bit weird to me redacting at this level.

Should we redact when this message is written to the db (?) instead? That would also cover some more cases. It feels a bit weird to me redacting at this level.

I think it's good in this case -> kwargs are really the only ones that can **potentially** leak secrets, and masking it here makes it way better because it also masks kwargs with sensitive names not only with sensitive values.

I think it's good in this case -> kwargs are really the only ones that can **potentially** leak secrets, and masking it here makes it way better because it also masks kwargs with sensitive names not only with sensitive values.

I see it the same, screened code and found no other place where such problem appears. If we redact on this level we have less false-positives (having a secret term in the function signature name getting masked) as well as no secret values are sent over API to write to DB.
