# SSH\_FXP\_OPENDIR may Lead to Exhaustion of File Handles

High u3s published [GHSA-79c4-cvv7-4qm3](#) on Sep 10, 2025

## Package

### OTP

#### Affected versions

>= 17.0

#### ssh (OTP)

>= 3.0.1

#### Patched versions

28.0.3, 27.3.4.3, 26.2.5.15

5.3.3, 5.2.11.3, 5.1.4.12

## Description

### Impact

Code handling SSH\_FXP\_OPENDIR operation does not allocate OS level file handle, but does create a file handle in Erlang VM.

Since OS file handle is not created, OS level limitations will not be applied. As a result the list of file handles might grow until resource consumption of Erlang VM affects the system stability.

This is a server side vulnerability.

### Workarounds

- disabling SFTP
- limiting number of max\_sessions allowed for sshd, so exploiting becomes more complicated

### Affected/Unaffected Versions

A version larger than or equal to one of the listed *patched versions* is **unaffected**; *otherwise*, a version that satisfies an expression listed under *affected versions* is **affected**, and if it does not, it is **unaffected**.

The documentation of the new [OTP version scheme](#) describes how versions should be compared. Note that versions used prior to OTP 17.0, when the new *OTP version scheme* was introduced, are never listed since it is not well defined how to compare those versions.

In the case of this vulnerability, versions prior to OTP 17.0 are likely also affected.

## Severity

High 7.1 / 10

### CVSS v4 base metrics

#### Exploitability Metrics

Attack Vector	Network
Attack Complexity	Low
Attack Requirements	None
Privileges Required	Low
User interaction	None

#### Vulnerable System Impact Metrics

Confidentiality	None
Integrity	None
Availability	High

#### Subsequent System Impact Metrics

Confidentiality	None
Integrity	None
Availability	None
