## Bug report

### Bug description:

I am reading tar blocks from a stream. The stream can be resumed from an arbitrary position, therefore I am using `tarfile.open` with `ignore_zeros=True`. This works most of the time, but sometimes resuming causes a `tarfile.StreamError: seeking backwards is not allowed`. After inspection, it seems that this is caused by blocks passing the checksum test even though they are invalid. This causes wrong metadata to be parsed, which in turn causes the stream to crash.

Below is a minimal working example with a problematic block. This is a real block in my stream which is yielded from an archive created with `tarfile`. The archive is not corrupted, and when streaming from the beginning of the archive, everything works fine.

```
import io
import tarfile

buf = b'\xff\xff\xff\xff\x00\x00\x00\x00\xff\xff\xfe\xff\xff\xff\x00\x00\x01\x00\x01\x00\x00'
f = io.BytesIO(buf)

with tarfile.open(mode="r|", fileobj=f, ignore_zeros=True) as tar:
```

After having a look at the GNU tar code, I can see [offsets must be non-negative numbers](#). I will put together a PR for this one.
