# Heap Buffer Over-read (up to 31 bytes) in SM2 Decryption via Undersized C3 Hash Field

High randombit published **GHSA-7jj6-4r42-w9h6** last week

## Package

**botan**

### Affected versions

2.3.0 - 3.10.0

### Patched versions

3.11.0

## Description

### Summary

During SM2 decryption, the code that checked the authentication code value ( `c3` ) failed to check that the encoded value was of the expected length prior to comparison. An invalid ciphertext can cause a heap over-read of up to 31 bytes, resulting in a crash or potentially other undefined behavior.

### Impact

Any application using Botan's SM2 encryption for message decryption is affected. An attacker can send a crafted SM2 ciphertext that causes a 31-byte heap buffer over-read, likely crashing the process (DoS). SM2 is used in Chinese standards-compliant TLS (TLCP), payment systems, and enterprise applications where servers process attacker-controlled ciphertexts over the network.

- **Availability: High:** Process crash or other undefined behavior
- **CWE-125:** Out-of-bounds Read

## Severity

High 8.2 / 10

### CVSS v3 base metrics

Attack vector	Network
Attack complexity	Low
Privileges required	None
User interaction	None
Scope	Unchanged
Confidentiality	Low
Integrity	None
Availability	High
