

**[security] Go 1.24.1 and Go 1.23.7 are released** 2,516 views**anno...@golang.org**

to golan...@googlegroups.com

Hello gophers,

We have just released Go versions 1.24.1 and 1.23.7, minor point releases.

These minor releases include 1 security fixes following the [security policy](#):

- net/http, x/net/proxy, x/net/http/httpproxy: proxy bypass using IPv6 zone IDs

Matching of hosts against proxy patterns could improperly treat an IPv6 zone ID as a hostname component. For example, when the NO_PROXY environment variable is set to `:::1%25.example.com:80` would incorrectly match and not be proxied.

Thanks to Juho Forsén of Mattermost for reporting this issue.

This is CVE-2025-22870 and Go issue <https://go.dev/issue/71984>.

View the release notes for more information:

<https://go.dev/doc/devel/release#go1.24.1>

You can download binary and source distributions from the Go website:

<https://go.dev/dl/>To compile from source using a Git clone, update to the release with `git checkout go1.24.1` and build as usual.

Thanks to everyone who contributed to the releases.

Cheers,

Junyang and Michael for the Go team
