About us

As a Hardware Security Engineer, I specialize in uncovering the intricate layers of physical and embedded systems to uncover vulnerabilities before adversaries can exploit them. I specialize in techniques such as firmware extraction, side-channel attacks, glitching, fault injection, black-box analysis, UART/JTAG debugging, and reverse engineering PCB and chip-level architectures. The goal is to bridge the gap between hardware and cybersecurity — ensuring that from the silicon to the software, every layer of an IoT device or embedded system is resilient against real-world attacks. My passion lies in not just finding vulnerabilities but deeply understanding how hardware operates, how it can fail, and how security can be woven directly into its design. The logo represents this mission: • The shield for protection and defense, • The microchip for embedded systems, • The magnifying glass for in-depth vulnerability research, • The soldering iron for real-world hardware

interaction and exploitation, • The circuit paths for connectivity and complexity in modern IoT ecosystems. In a world rapidly moving toward billions of interconnected devices, hardware security is not optional — it's foundational.

Who knew **Staring** at CVEs for hours would eventually pay ₹60,000? 😊

It all started with a simple thought...

“Let’s just participate and see what happens.”

Well... we almost didn’t. 😊

We missed the initial submission window, and just when we thought the opportunity was gone, registrations reopened for a very short time. We rushed, submitted our idea at the last possible moment, and...

Fast forward...

🕒 48 hours of non-stop

☕ Countless cups of coffee

🐛 Bugs that appeared

💡 Last-minute ideas

😴 Sleep became optional

And somehow... we took home the **Winner** at **L&T Tech**

Our team, **CyberNova**, was inspired by real-world security insights, helping secure

ner-Up (**Silver**)
i!

ntelligence platform
CVEs into actionable
aster.

More than the prize, this **Hackathon** was about learning, collaborating, pushing our limits, and proving that sometimes the craziest ideas are worth taking a chance on.

A huge shoutout to my amazing teammate **Ujwala Kontham** for surviving the 48-hour roller coaster with me, and heartfelt thanks to **Larsen & Toubro** for organizing such an incredible platform for innovation.

I guess the lesson is...

Sometimes the best decision is simply clicking “Submit” before it’s too late. 😊

Beyond **Detection**. Toward **Prevention**. 🛡️

Marketing Genius 💡: Cadbury 🍫

How Cadbury Dairy Milk Turned “Kuch Meetha” into Itself 💕

Today I saw a dad buying a Cadbury for his son.

Reason? He just scored amazing marks in his 10th boards. 📄✨

No cake. No big celebration.

Just one line:

“Chal, isi baat pe kuch meetha ho jaaye.”

And that got me thinking...

This line existed in India way before Cadbury.

A cultural reflex for every small or big good moment.

But over time, something changed 🙄

“Meetha” didn’t stay

In most people’s head

That’s what they nail

Not selling chocolate

So now it’s not even

Good news → Meetha

Effortless. Automatic.

That’s not just brandi

That’s becoming part

I walked into a “smart” **trial room** to try something very... personal 😊

Underwear level per

Door closed.

Lights on.

And suddenly a screen

“Touch the screen to

Bro... I came here to

Then it gets better.

The screen already k

It showed the exact i

“Bring me this item.”

So while I’m checking

a system is tracking v

Behind that fancy mi

- a touchscreen
- a mini computer
- a network connection
- and software talking to the store backend

Which means the trial room is no longer just a private space.

It’s a data collection zone.

And then I **Noticed** something even more interesting 🧐

A **USB** female port was literally hanging out from behind the screen.

Yes, that blue USB you see in my hand in the photo.

So today I was brushing  my teeth, and I was like, "Wait, something...
The toothpaste I use every morning is actually a night toothpaste. 🤔

My first thought wasn't "oops."
It was: bro... will it have negative effects? 🤔

Naturally, I went down a mini rabbit hole.
Is there some hardcore science behind day vs night toothpaste? 🤔
Different powers? Different missions?

Turns out... not really. 🧑🏻♀️

Tiny ingredient differences, sure.

But the real magic? Marketing 🪄

Same habit. Same bathroom. Same me.

But now the brand has me thinking I need two toothpastes to be a responsible adult.

They didn't change my teeth.

They changed my routine. 🧑♀️

And that's when it hit me — marketing isn't always loud campaigns or big ads. 🗣️

Sometimes it's quietly convincing you that your morning toothpaste is wrong.

MBA in marketing really makes you overthink life.

Even brushing your teeth isn't safe anymore 🧐🪄

Ever noticed the tiny text flashing on the digital indicators inside **Mumbai Local Trains**?
Something like:

Address-01L
Sw.ver-2.04

Most passengers ignore it, but your brain probably registers it.

Here's the thing—those tiny characters are not just random noise.

Address-01L

This is the network address for the train's internal communication bus.

Each panel is a node on this bus, and it pushes configuration updates to the rest of the train.

It's basically a MAC-t

That's the firmware version running on the microcontroller inside the display.

Why it matters:

- Tracking bugs
- Checking compatibility
- Rolling out fixes across hundreds of coaches
- Auditing old builds during security reviews

In **IoT Security**, we see this daily. Hardcoded firmware, unpatched versioning, device enumeration... and when scaled across entire city networks, this becomes critical infrastructure security.

What this really means is:

Even something as ordinary as a local train quietly runs on embedded systems, firmware logic, network addressing, and strict version control.

Security teams often focus on web, cloud, and apps, but the real world runs on Hardware that never asks for attention... until it breaks.

Next time you travel, look around.

Cybersecurity isn't always behind a screen.

Sometimes it's printed right above your head on a rattling suburban train.

CVE-2025-10546

Back in March, my friend and I discovered a vulnerability in the **Broadband** HomePower router. We analyzed its behaviors, and soon we found a flaw in the router's diagnostic interface.

A simple **Payload** like

```
<script>alert(1)</script>
```

was enough to exploit the router. What was the Impact? Session hijacking, turning the router into an attacker.

We went the full response, creating a detailed video POC - and sharing it with the vendor.

What I truly appreciate is the professional coordination and support from the vendor's security team.

Now, it's official:

- ✓ Published on CERT-In: CIVN-2025-0215 <https://lnkd.in/d6vQZWta>
- ✓ Public CVE: CVE-2025-10546 https://lnkd.in/dqa59h_r

For me, this achievement isn't about "one more CVE ID."

It's about the journey - from spotting a small bug, proving its impact, disclosing responsibly, and working with teams who genuinely care about security.

Big thanks to Amey for collaborating on this and to CERT-In for closing the loop.

Every CVE reminds me why I chose this field: making connected devices safer for everyone.

#CyberSecurity #IoTSecurity #HardwareSecurity #VulnerabilityResearch
