GoAnywher
e MFT, a
popular file
transfer
application,
is warning
about a
zero-day
remote
code
injection
exploit. The
company
said it has
temporarily
implement
ed a
service
outage in
response.

I had to
create an
account on
the service
to find this
security
advisory,
so I'll just
paste the
advisory
here:

"On Prom

n/Technica l BulletinFeb 1, 2023

A Zero-Day Remote Code Injection exploit was identified in GoAnywhere MFT. The attack vector of this exploit requires access to the administrative console of the application, which in most cases is accessible only from within a private company network, through VPN, or by allow-listed IP addresses (when running in

[Create account](#)[Login](#)

nts, such as Azure or AWS).

If the administrative console is exposed to the public internet, it is highly recommended partnering with our customer support team to put in place appropriate access controls to limit trusted sources.

The Web Client interface, which is normally accessible from the public internet, is not susceptible to this

[Create account](#)[Login](#)

administrative interface.

If your administrative interface had been publicly exposed and/or appropriate access controls cannot be applied to this interface, follow these steps to evaluate and mitigate your exposure:

1. Review all administrative users

Evaluate your admin user accounts for anything suspicious.

[Create account](#)[Login](#)

on these
accounts
include:

Unrecogniz
ed
usernames

You can
view more
details by
clicking the
cog icon
next to any
User Name
listed and
selecting
the "View"
option.

The
Created By
details
show
'system'

Note: There
are some
default, or
initial
admin user
accounts
that are
created
automatica
lly - either
through
initial

This is actually pre-auth RCE, 100% confirmed and their advisory sucks. Good luck to their customers!
