## Risks CVSS 5.4

Vulnerabilities like this one are used in mass-exploit campaigns. Attackers use these to attack thousands of websites at a time, regardless of traffic size or popularity.

[Pricing](#)[Case studies](#)[Login](#)[Start trial](#)

As immediate action, update the affected plugin. If you're unable to do so, ask your hosting provider or web developer for help.

### **User Interaction Required**

While this vulnerability can be initiated by the role shown in "Required Privilege", successful exploitation requires a privileged user to perform an action — such as clicking a malicious link, visiting a crafted page, or submitting a form.

### **5.4 Cross Site Request Forgery (CSRF)**

This could allow a malicious actor to force higher privileged users to execute unwanted actions under their current authentication.

CVSS score is a way to evaluate and rank reported vulnerabilities in a standardized and repeatable way but which is not ideal for WordPress.

## Solutions

This security issue has a low severity impact and is unlikely to be exploited.

### **Update to version 2.0.3 or later.**

Update to version 2.0.3 or later to resolve the vulnerability. Patchstack users can turn on auto-update for vulnerable plugins only.
