Submit #787031: code-projects Easy Blog Site In PHP 1.0 SQL Injection

Title	code-projects Easy Blog Site In PHP 1.0 SQL Injection
Description	<p>A SQL Injection vulnerability exists in the Easy Blog Site in PHP within the contact form functionality.</p> <p>The vulnerability occurs in the following endpoint:</p> <pre>/blog/users/contact_us.php</pre> <p>The application processes user input submitted through an HTTP POST request. The name parameter is user-controlled and is incorporated into backend SQL queries without proper validation or sanitization.</p> <p>Testing confirmed that the name parameter is vulnerable to time-based SQL injection, indicating that attacker-supplied SQL expressions are executed by the database engine.</p> <p>By injecting a crafted payload into the name parameter, an attacker can manipulate the SQL query. In the provided request, a delay-based SQL payload using the SLEEP() function was used:</p> <pre>name='+ (select*from(select(sleep(20)))a)+'</pre> <p>When the request is processed, the server response is delayed by approximately 20 seconds, confirming successful execution of the injected SQL statement.</p> <p>This demonstrates that the application directly includes user input in SQL queries without using prepared statements or parameterized queries.</p>
