Changelog

6.29

- New: Additional validation has been added to prevent people from manipulating amount values when making Stripe payments.
- Fix: When updating the Stripe processing message global setting with strings contained backslashes, extra backslashes would get added with each time the global settings were updated.
- Fix: Usage tracking code would trigger a `str_contains(): Argument 1 must be string, stdClass given` warning.
- Fix: Credit card fields would appear blank in some previews, like when previewing a Gutenberg block.
- Fix: The field options dropdown for the far left field would render underneath the field settings sidebar in rows with a lot of fields.
- Fix: An Undefined array key “slug” PHP Warning has been fixed.
- Fix: When a missing payment field is automatically added to a form with a payment action, the new field would incorrectly appear below the submit button.
- Breaking: The deprecated `FrmDb` constructor method has been removed.

6.28

- New: Required changes to support the new option limits settings in Pro and the new redesigned fields in Views settings.
- Performance: The cached license data has been reduced significantly, omitting change log data and data for invalid plugins. The size of the auto-loaded option should be about 40% of its previous size.

6.27

- New: Displaying payments is now handled by this plugin, instead of falling back to Stripe, Authorize.Net, and PayPal. In cases where these add-ons were active, the payments table should now appear more modern.
- New: A new coupons tab is available on the payments page.
- New: Required updates to support a new View-Specific CSS setting in the Visual Views add-on.
- New: The submit button will now be enabled when a Square postal code is successfully completed. This fixes issues where the submit button would never get enabled when a Square card field was auto-filled.
- New: Many references to old font icons have been removed, removing about 10KB of data from admin CSS.
- New: Several styles have been optimized in the generated `formidableforms.css` file when Pro is not active, helping to reduce file size by removing references to features that only exist in Pro.
- Fix: Global custom CSS would incorrectly get added to the `formidableforms.css` more than once on some sites with multiple styles.
- Fix: The style-specific custom CSS setting would incorrectly get output in the `formidableforms.css` file as CSS variable data.

- Fix: The htaccess file included in this plugin is now automatically deleted when migrating to a new plugin version if a request to load CSS is blocked, fixing a conflict on some servers that are not configured to allow overwriting file permissions.
- Fix: A PHP warning would get logged when checking data for a ranking field as spam.
- Fix: Add-on category counts were not always correct.
- Breaking: Many modern PHP functions are now being used including `str_contains`, `str_starts_with`, `str_ends_with`, `array_key_last`, and `array_key_first`. If you are using both a WordPress version older than 5.9, and a PHP version lower than 8.0, this will introduce fatal errors. Note that the minimum required WordPress version is already set to 6.3.
- Breaking: The deprecated functions `FrmFieldCaptcha::captcha_size`, `FrmFormsHelper::should_use_pro_for_ajax_submit`, `FrmFormsController::add_form_style_tab_options`, and `FrmFieldType::get_select_attributes` have been removed.
- Breaking: The deprecated `FrmFormsHelper::actions_dropdown` function and `actions-dropdown.php` view file have been removed.
- An unused `FrmTransLiteSubscriptionsController::list_subscriptions_shortcode` function and its related view file have been deprecated.

6.26.1

- New: The cached data for license checks is now set to autoload to help reduce calls to the database, and an option check for a request lock has been moved so it only happens when the option data has expired. These changes should help with performance.
- New: SVG icon updates have been made to avoid use of the deprecated `xlink:href` attribute.
- Fix: Field step settings were changed to only accept numbers in last release, causing issues with “any” as a value.
- Fix: Bootstrap dropdowns would not properly initialize for fields loaded with AJAX in long forms, preventing access to the more options dropdown, hiding the option to delete a field.
- Breaking: Old logic that would trigger blur events for inputs with no value set with the `onblur` attribute has been removed.
