
CompuPhase focuses on programming of applications, and on the design and production of (programmable) electronics. In business since 1986, we have acquired expertise in the design and production of electronics and technical software, including embedded systems, graphical applications and system software.

More specifically:

- o development of electronic devices and embedded systems
- o development of general purpose or system software (e.g. device drivers) under DOS, Windows, Linux and various RTOS implementations; multi-lingual (international) software
- o our high-quality products and semi-manufactured parts, which are available from stock
- o company presentations and product presentations (e.g. via information kiosks)
- o special lighting projects, using fibre optics or high-power LEDs

Detailed information on our activities can be found under the TAB-sheet "Projects" and in our collection of articles and technical documentation (mostly aimed at programmers and electronic engineers); errata and additions to the published articles are available here as well.
